Product Experience Research Report Samsung Galaxy SIII Smartphone

Core & Differentiable Experience:
Initial Setup & Usage

Date: 07.22. 2012 07.31.2012 updated

Design & Technology Product/User Research

Samsung Telecommunications America

Executive Summary

Critical Tasks Failure Points

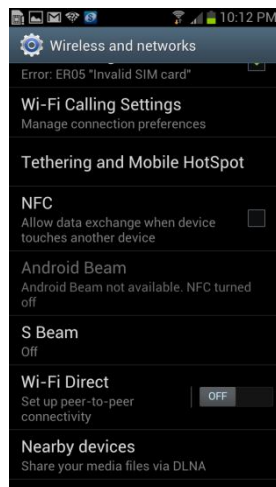

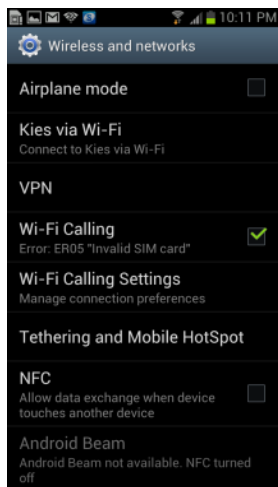

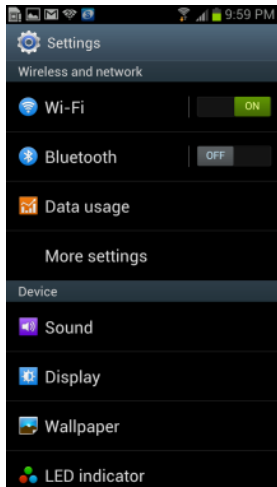

Galaxy SIII Differentiable Product Experience – S Beam

Setting Up S Beam: Discovery (Task Failure Rate: 35%)

Results:

Consumers found the initial setup of S Beam challenging. Eight out of 23 could not complete task within 2 minutes. Another eight could only complete the task with multiple trials. Consumers would not anticipate S-Beam would need to be turned on before use.

Respondents did not anticipate S-Beam was turned off by default and had expected it would work out of the box.

Suggestions based on respondents' feedback:

1. A setup app or widget to customize the key differentiable features of the product.
2. Out-of-Box support for S Beam (default on) instead of "off".

Galaxy SIII Differentiable Product Experience – S Beam

Using S Beam: Usability

Results:

Consumers found using S Beam easy and straightforward except for minor difficulties in the onscreen instruction cue “Touch to beam”. Respondents tried to touch the label instead of the object (e.g., photo) to initiate beaming.

One minor usability problem was the textual label of “Touch to beam” – many respondents would tap on the textual label itself multiple times, only finding that it did not respond and S-Beam timed out.

Suggestions based on respondents’ feedback:

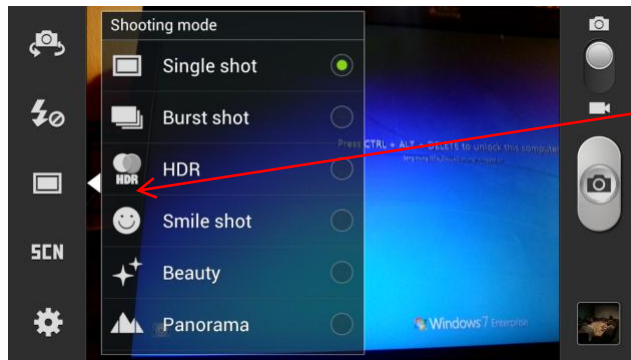

1. Provide explicit visual cue to the object from the label “Touch to beam” (e.g., “Touch picture to beam”)

Galaxy SIII Differentiable Product Experience – Share Shot

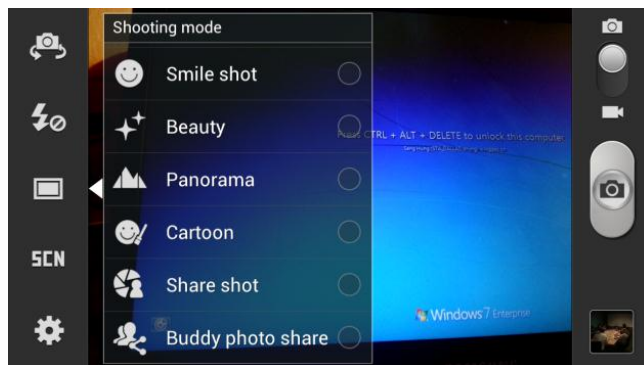

Share Shot : Initial Discovery of Share Shot (Task Failure Rate: 52%)

Results:

Consumers found invocation of Share Shot challenging. Twelve out of 23 could not locate where to initiate Share shot within 2 minutes. Once the function was invoked, the task was relatively straightforward to follow through with good completion rate.

The option was hidden under Shooting mode and the scroll bar disappeared quickly after the Shooting mode button was hit. Many respondents were not aware of additional items available under “Shooting mode”.

Suggestions based on respondents' feedback:

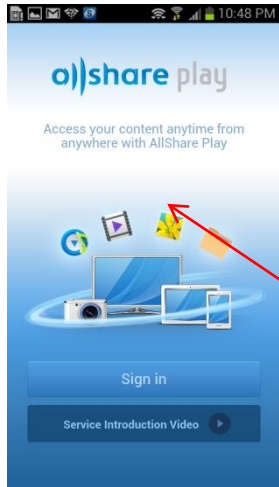

1. A Share shot Shortcut or Widget in one of the homescreens to launch directly into camera, ShareShot Shooting mode.
2. A visible scrollbar indicator in the camera user interface.

Galaxy SIII Differentiable Product Experience – Join AllShare GroupCast

Finding where to join AllShare Play GroupCast (Task Failure Rate: 43%)

Results:

Consumers have difficulties in discovering how Groupcast can be set up. Nine out of 21 could not complete the task within 2 minutes. Another 6 took some trials and errors to discover where to join GroupCast. They expected the icons to be touch buttons in the AllShare App and GroupCast can be joined (as well as started) by tapping on the icons .

Most of the respondents would intuitively click on the pictures and icons on the display, thinking that they were active onscreen buttons.

Suggestions:

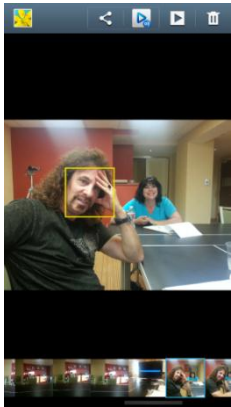

1. Users should be able to join Group Cast by tapping on icons dedicated to different supported features/functions (including Group Cast) from the Allshare play app home screen.
2. The “Join Group Cast” widget can be put in the same home screen as the shortcut to AllShare Play to increase visibility of feature

Galaxy SIII Differentiable Product Experience – Creating AllShare Play Groupcast

Starting AllShare Play Groupcast with multiple media (Task Failure Rate: 25% discovery of location where multiple selection was possible, 40% multiple selection)

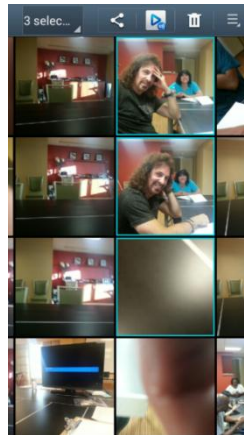

Results:

Consumers found starting AllShare Play Groupcast with multiple media difficult. In this task, half of the respondents (10 out of 20) went through the correct path to set up multiple selection of media (through Gallery instead of Camera App) in the first trial. Nine of them did multiple selection correctly in the first trial. At the end, 8 out of 20 respondents could not complete multiple selection.

Accessing pictures from camera app would not support multiple selection.

The only way to perform multiple selection of media was through Gallery app.

Suggestions based on respondents' feedback:

1. A “Start Group Cast” widget can be put in the same home screen as the shortcut to AllShare Play, to increase visibility of feature.
2. A “AllShare Play Apps Folder” can be used to support all the core features under AllShare Play. Users can follow through the launch of each feature step-by-step.
3. A more visible visual user interface and interaction design for multiple selection of media.

Galaxy SIII Differentiable Product Experience – AllShare Photo Streaming to PC

Finding AllShare Stream (Task Failure Rate: 19%)

Results:

Over half of the consumers (11 out of 21) had difficulties in identifying the icon for streaming initially. Four out of 21 respondents could not identify the icon after 2 minutes of trials and errors .

Over half of the respondents could not identify the “AllShare” integrated icon initially as streaming to other AllShare-enabled devices.

For most of those respondents who could not identify the icon initially, they would look for the feature invocation option under “Share” as their first attempt.

Suggestions based on respondents’ feedback:

1. Include the icon with textual label under the Share options icon would likely help respondents to learn the function.
2. Test different visual design of the AllShare “Integrated” icon

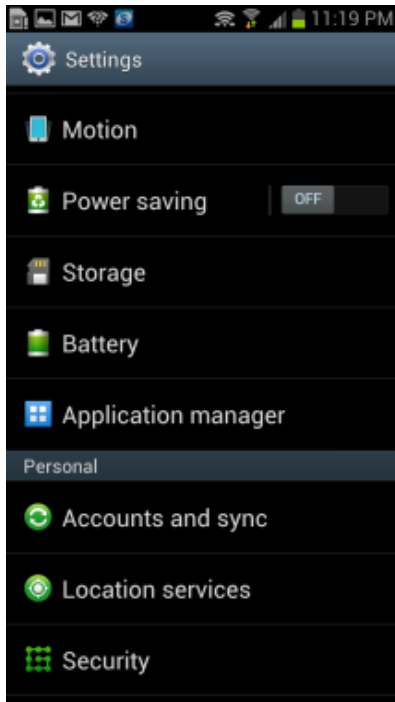

Galaxy SIII Differentiable Product Experience – News Ticker

Setting Up News Ticker in Locked Screen (Task Failure Rate: 74%)

Results:

Consumers found the initial setup of News Ticker extremely challenging. The settings were not easily discoverable. Only 6 out of 23 could complete task within 2 minutes.

Almost all respondents would not intuitively associate Lock screen options under “Security” during initial setup.

Suggestions:

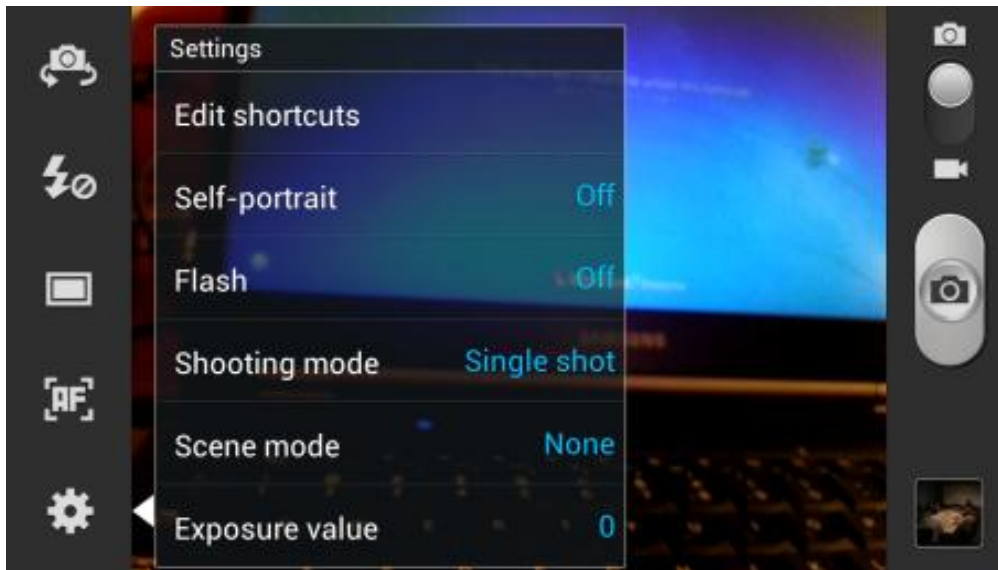

1. A setup app or widget to customize the key differentiable features of the product.
2. The “Locked Screen Options” can be moved from Settings: Security to more intuitive or visible location in the Settings menu.

Galaxy SIII Differentiable Product Experience –Voice Commands to take Pictures

Enabling Voice Commands to take Pictures (Task Failure Rate: 61%)

Results:

It was difficult for consumers to intuitively search under “Language and input”. Camera Settings were explored by most respondents first, followed by Sound and Accessibility settings. Fourteen out of 23 respondents could not turn on voice command to take pictures after 2 minutes of searching through Galaxy SIII.

Suggestions based on respondents' feedback:

1. Turning on/off Voice Command to take pictures can be accessible through Camera Settings menu.

Respondents were more likely to search the option to enable voice commands to take pictures under Camera Settings.

Detailed Report

Research Synopsis

Summary Results & Research Insights

Galaxy SIII Smartphone: Initial Setup and Usage of Core and Differentiable Product Experience

Overview

The purpose of this research was to identify UX improvement opportunities of the differentiable product experience of Galaxy SIII. It was conducted in late June 2012 at San Diego (N=23)

Tasks

1. Respondents interacted with a Galaxy SIII Self-Guided Sales Station in a simulated retail environment, watched short videos for retail and used TecTiles to launch and watch videos customized highlighting differentiable product features of sharing. They evaluated the usability of interactive demonstration station as well as completed product concept evaluation of Galaxy SIII.
2. Respondents attended a sales demonstration session highlighting differentiable product features. They evaluated the importance and usefulness of the highlighted features.
3. Respondents were given Galaxy SIII smartphones and performed initial Gmail account setup and exploration of core features/applications. They evaluated the usability and ergonomics of the device.
4. Respondents performed a series of initial setup and usage tasks of differentiable product experience related to S-Beam, Information Ticker in locked screen, Voice command for camera, Share Shots, All Share Play, GroupCast and TecTiles. They evaluated usability and importance of those features.
5. Respondents completed System Usability Score and product concept evaluation of Galaxy SIII smartphone.

Results

Although the reactions to Galaxy SIII smartphone were highly positive, there were critical usability issues related to initial setup of some of the differentiable product features. The high failure rates of discovery or initial usage would likely cause substantial frustrations for new owners of Galaxy SIII. Besides, those differentiable features might never get used and the owners would not get the full benefits of Galaxy SIII.

Most problems in the initial setup were related to the discovery of settings or usage of those product features. Many of them were hidden in unanticipated options in Settings. Most users, for instance, would look for News Ticker setup for locked screens under “Display”. Many of them would also look for apps or widgets related to news. They did not anticipate that the setup option would be under “Security”. For the voice command to take pictures, most respondents would first search for the settings within the camera application, they would also search “Sounds” and “Accessibility” in the “Settings”. They did not expect the option would be found in “Language and Input”.

Recommendations

Opportunities for improvements of Galaxy SIII included the following:

Short-term

1. Turn on some of the differentiable product features by default, e.g., S-Beam can be set on by default.
2. Organize the Settings menu in a more logical/natural way according to the highlighted product experience, e.g., use a “Sharing” option under Settings to organize.

Long-term

1. The option to turn specific features on/off related to an application should be accessible within the application itself, e.g., turning on and off voice command for taking pictures should be accessible from the camera.
2. A widget or app can be used to help users to customize their smartphone, including direct access to the highlighted differentiable features and help/resources to set up and use those features.

Galaxy SIII Smartphone : User Experience

Differentiable Product Experience: Initial Setup and Usage

Insight:

Consumers are generally impressed with the demonstration and usage of differentiable product experience like “One Touch Sharing” (S-Beam), Share Shots, Voice Command to take pictures of Galaxy SIII. The self-guided interactive sales station (NFC Pad with TecTiles) serves to highlight the unique features around “Sharing” through videos. As for the actual hands-on setup and usage of Galaxy SIII, the experience is marred by usability issues of configuring or discovering those features for usage. However, purchase interest and positive impression of Galaxy SIII remained very high after in-depth (and sometimes frustrating) product experience evaluation.

Initial Product Experience

While the initial setup of the Gmail and the exploration of core experience (dialer, messaging, web browsing etc.) was excellent, there were high failure of setting up and in some cases using differentiable product experience features like news ticker on locked screen, S-Beam, voice command to take pictures, Groupcast. Some features such as voice command to take pictures were found to be working inconsistently during usage.

Consumers Anticipation

Participants of the research, especially those with current Android phones expected that new technology products would have some degree of usability and functional problems. They anticipated those would be resolved over time after device vendors tweak and fix those issues. Respondents with iPhones tend to be more critical of the setup and usage problems they encountered during the evaluation sessions.

Opportunities

Creating consistent and discoverable interaction models of differentiable product experience will reinforce the value of the Galaxy SIII after purchase. Avoiding the initial frustrations of setting up/using the unique product features of the device may help to cut down return rate of smartphones and enhance the brand image, boosting loyalty in the longer run.

Design pitfalls: Initial Discovery and Setup

Commonly encountered issues

- Setting up News Ticker
- Setting up Voice Commands to take pictures
- Initial Invocation of Share Shot
- Setting up S-Beam
- Joining GroupCast
- Creating GroupCast and Selecting Multiple media

These design issues were explained with examples in the report. Some respondents were overwhelmed by the interface during tasks and needed moderator guidance to complete the task.

Ideal Path

Observed path

Galaxy SIII: Initial Experience at
Retail with self-guided Demo
Station & Salesperson Demo

Galaxy SIII Interactive Sales Demo Station (NFC/TecTiles) User Experience

Self-Guided Tour of Galaxy SIII

Results:

More than 90% of consumers enjoy the interactive experience of the station and think that the videos are informative. The experience can be further improved with explicit instructions of using TecTiles to launch videos.

Respondents were asked to walk up to the self-guided interactive sales station and explored the exhibit for about 5 minutes. Respondents would be prompted to make use of the TecTiles to launch videos of the corresponding “sharing” usage highlighted in the exhibit if the respondents did not do that after 2 or 3 minutes of exploration.

Although most respondents thought that they could walk through the interactive station without assistance, it took respondents more than 1 trial to get the Galaxy SIII smartphone attached to the security device working with TecTiles to launch videos for specific features.

Comments from the respondents suggested that the diagrams shown on the exhibit did not show how to place the device on TecTiles accurately. They were also confused by the name “TecTiles” and did not know what they were for. More explicit instructions and accurate depiction of how to place handset on TecTiles will be helpful.

Overall, the experience of consumers to the interactive sales station is very positive.

The picture should show placement of a Galaxy SIII attached to security cradle on TecTiles. The location of the back of device for placement should also be marked on the actual demonstration unit.

Diagram should show both devices touching back to back to ensure NFC connection. S-Beam demonstration was clumsy and difficult because of the security attachment.

More explicit instruction should be given to place smartphone on TecTiles. A brief description and explanation of TecTiles should also be given.

Galaxy SIII Sales Demonstration and perceived differentiable product experience

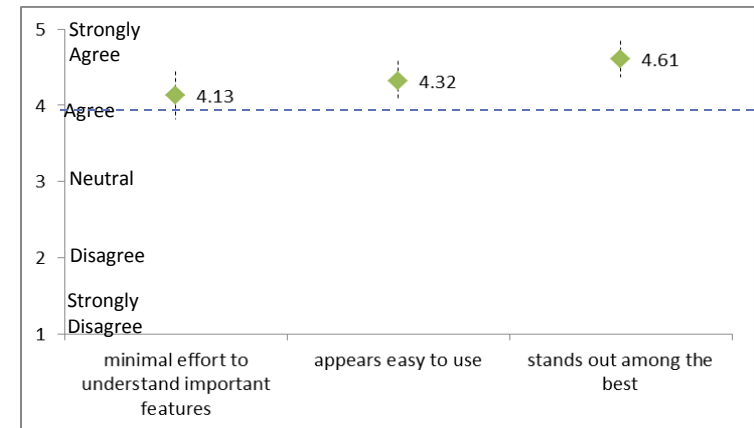

Consumers' Perception of galaxy SIII after Salesperson Demonstration

Results:

Consumers are impressed with the sales demonstration of features and agree that it takes minimal effort to understand important features of Galaxy SIII and it appears to be easy to use. They also agree that Galaxy SIII stands out among the best smartphones they have had seen.

The following features were demonstrated: S-Beam, Burst/Best Shots, Direct Call, Smart Stay, Share Play (streaming to PC using a HD TV as monitor), TecTiles (connecting to Pandora), and PopUp Play. After the demonstration, 14 out of 23 respondents indicated that they would purchase Galaxy SIII while 8 would wait and compare Galaxy SIII with iPhone 5 and 1 for Blackberry RIM smartphone. Note the purchase intent results were not statistically significant.

Comments captured from consumers after the product demonstration showed that consumers, irrespective of the brand of their smartphones, were very impressed with the product features. Apple iPhone owners and intenders also indicated highly positive views of Galaxy SIII.

Participant	Prefer	Current	Comments
Jacque P.	Galaxy S3	HTC Evo	My daughter is looking for a new phone and this one would be great for her
James J.	Galaxy S3	Motorola Photon	Too many great features on the Samsung! It makes me want to buy it.
Adma L.	Galaxy S3	Samsung Galaxy Nexus	These new phones should be able to have tegra 3 (quad core) & LTE
Shirley L.	iphone5	HTC Nexus One	I would prefer to wait and compare the difference between the capability between the two. I'm not familiar with Galaxy brand but I'm happier today have played w/ the phone
Samantha IV	iphone5	Samsung Infuse	The phone blew me away, so many very cool features that would make you feel trendy and in the know. I can see the usefulness of the features
Mike C.	Galaxy S3	Motorola Droid 2	I really like the phone. I may wait for more colors
Barbara B.	Galaxy S3	HTC Inspire	I would purchase this phone. :)
Ken F.	Galaxy S3	Motorola Atrix	Great features, intuitive, big screen
Jackie M.	Galaxy S3	Apple iPhone4s	Love the Galaxy SIII!!
Cameron L.	Galaxy S3	LG Ally	Nice phone in terms of video/picture camera quality, but a lot of phone-specific features seem gimmicky (especially if your friends don't have the same phone as you)
Tin N.	Galaxy S3	Samsung Vibrant	Galaxy S3 is very unique and different from other phones
Paul W.	Galaxy S3	HTC Incredible 2	Amazing!
Chardae J.	Galaxy S3	Apple iPhone4s	This phone is great
Brandye C.	iphone5	Apple iPhone4s	Great phone is it only offered through Verizon?
Anna C.	iphone5	Apple iPhone4	I love my iPhone so it's hard for me to change phones but this phone is really cool and almost makes me change my mind.
Ray V.	iphone5	HTC Evo	I'll buy this phone after comparing iPhone 5 if it stands out above it
Marc C.	iphone5	Apple iPhone4s	The device is great but minimal in use, though it offers unique features the limitation is brought by resource/cost; (i.e., true time cost) and actual use innovative features I'd like to see on my

Galaxy SIII Sales Demonstration and perceived differentiable product experience

Convenience, Usefulness and Importance

Results:

Consumers agree that all the features demonstrated are convenient and useful. Both S-Beam and Direct Call are more important to consumers than PopUp Play.

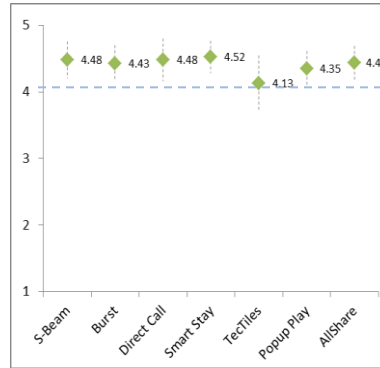

Respondents were given a typical sales demonstration of Galaxy SIII differentiable product features by the moderator using the guidelines for in-store sales representatives. They completed a questionnaire on their perceived convenience, importance and usefulness of the features demonstrated after the presentation. Both convenience and usefulness of all the features demonstrated were rated highly.

It was observed that in all the 12 sessions, respondents would ask moderator to clarify what was "Smart Stay" when they were answering the questions, pointing to the possible problem of the feature name and meaning to consumers. Clarification of "All Share" was asked once among the sessions.

There were no significant differences between all the features demonstrated in convenience and usefulness ratings. Consumers agreed that all the features demonstrated are convenient and useful.

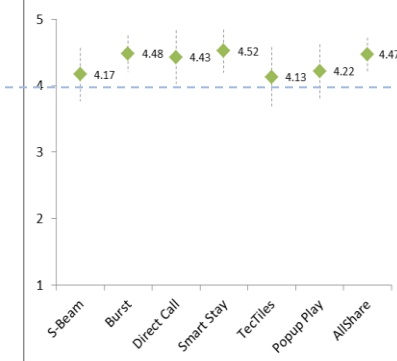

As for ranking of importance, both *S-Beam* and *Direct Call* were ranked significantly more important than PopUp Play.

Convenience

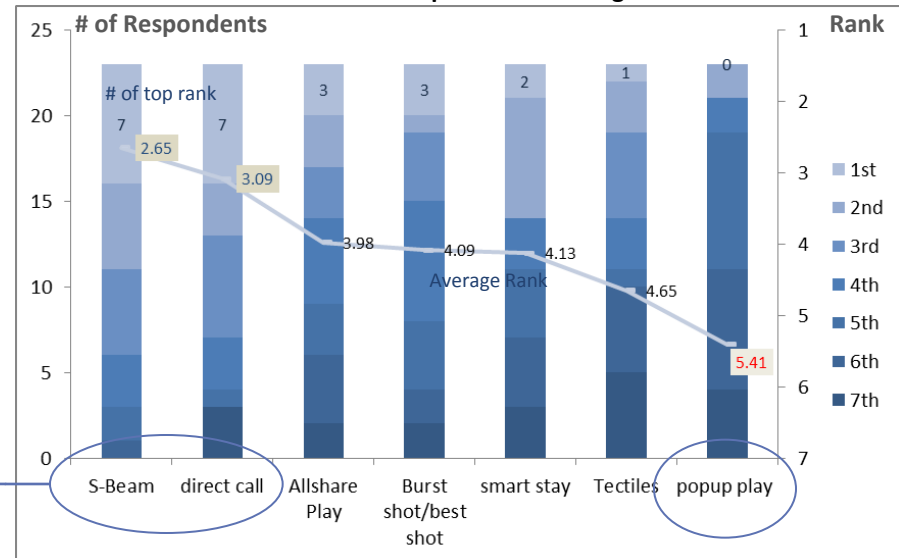

Strongly Agree
Agree
Neutral
Disagree
Strongly Disagree

Usefulness

Feature Importance Ranking

S-Beam and Direct Call are significantly more important to consumers than PopUp Play.

Galaxy SIII:
Ergonomics, Initial Setup & Core
Applications

Galaxy SIII Physical Ergonomics and Industrial Design

Form Factor, Weight and Display Size

Results:

Consumers find the display size of Galaxy SIII is large and its length is long but acceptable. The width, thickness and weight of the device, on the other hand, are just right. They also find Galaxy SIII is big but acceptable to carry around.

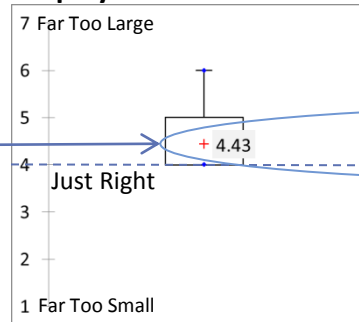

Respondents were given Galaxy SIII smartphones. They performed initial Gmail account setup with their own accounts (if available) or with a test Gmail account. The respondents would spend 5 minutes to explore the core features.

Device length is long, display size (and to carry it around) is big but they lie within the acceptable range of the consumers.

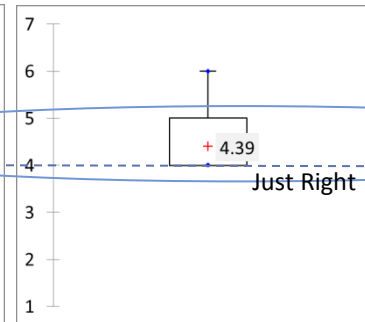

They also evaluated the physical ergonomics and overall design of Galaxy SIII including form factor, weight and whether it is too big to carry around.

Out of the 23 participants, 15 agreed that large display size is more important than size of smartphone (for portability) while 5 agreed that size of smartphone (portability) is more important than a large display. Three did not express any preference between trade-off of display size and smartphone size

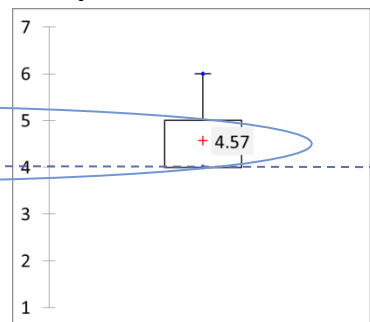

Display Size

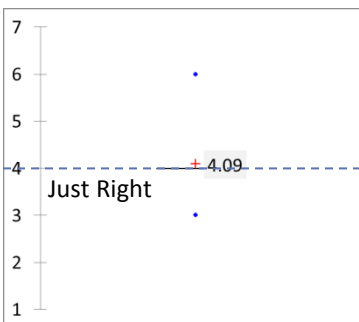

Device Length

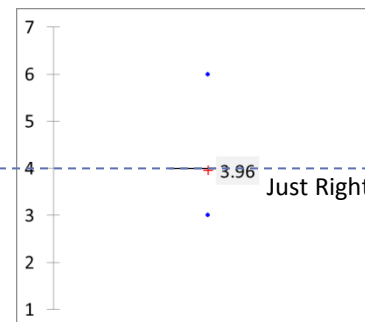

Carry Around

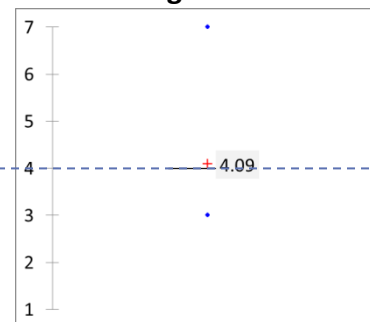

Device Width

Device Thickness

Device Weight

Galaxy SIII Physical Ergonomics and Industrial Design

Comfort – One-hand and two hand use, Portrait and Landscape

Results:

Consumers find the comfort to use Galaxy SIII with one-hand in the landscape orientation is relatively lower compared to one-hand portrait and 2-hand portrait as well as landscape usage. Overall, consumers like the size of Galaxy SIII.

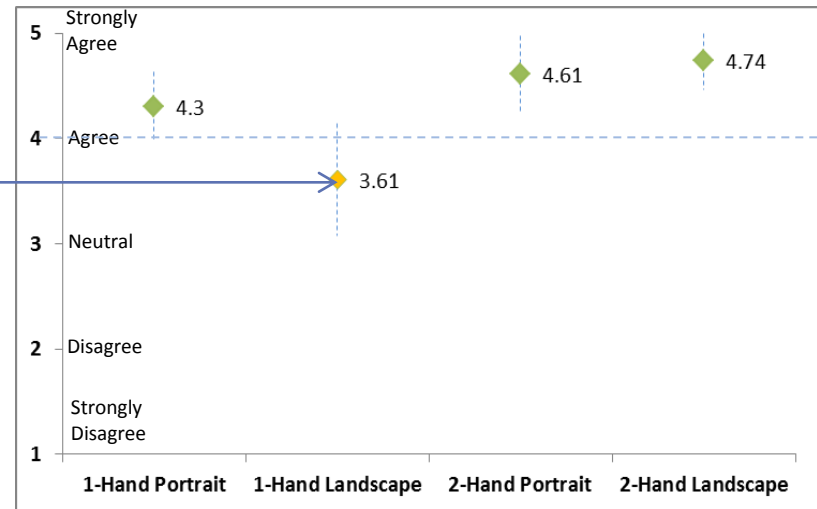

Respondents were given Galaxy SIII smartphones. They evaluated its comfort of use with 1-hand or 2-hand in portrait/landscape orientation.

Comfort to use 1-Hand Landscape is significantly lower than 1-Hand Portrait, 2-Hand Portrait and Landscape.

They also evaluated the physical ergonomics and overall design of Galaxy SIII including form factor, weight and whether it is too big to carry around.

They performed initial Gmail account setup with their own accounts (if available) or with a test Gmail account. The respondents would spend 5 minutes to explore the core features .

Comfort

Galaxy SIII Physical Ergonomics and Industrial Design

Industrial Design and Display

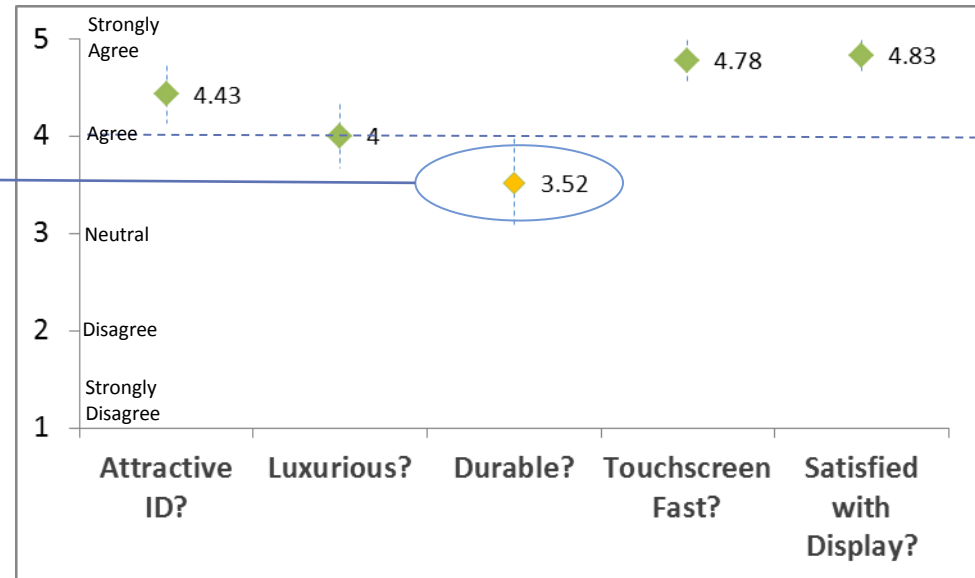

Results:

Consumers agree that the industrial design of Galaxy SIII is attractive. They are highly satisfied with the performance of the touchscreen and the display. They are less positive about the durability of Galaxy SIII, commenting on the “plastic” feel of the device. A significantly higher number of consumers also report larger display size is more important than device size for portability in the context of this device.

Durability was rated lower than most other attributes.

Respondents rated both the industrial design.

Out of the 23 participants, 15 agreed that large display size is more important than size of smartphone (for portability) while 5 agreed that size of smartphone (portability) is more important than a large display. Three did not express any preference between trade-off of display size and smartphone size.*

* K-proportion test with Marasuiolo procedure.

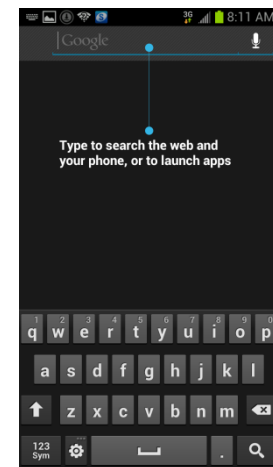

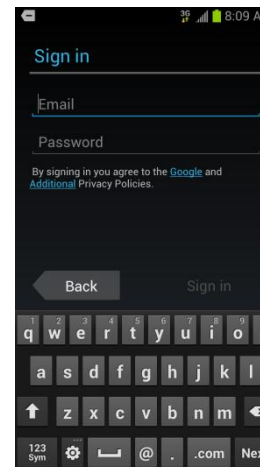

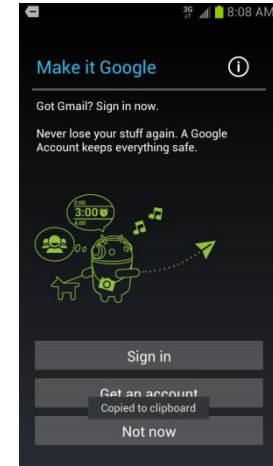

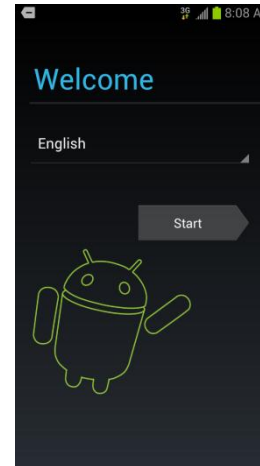

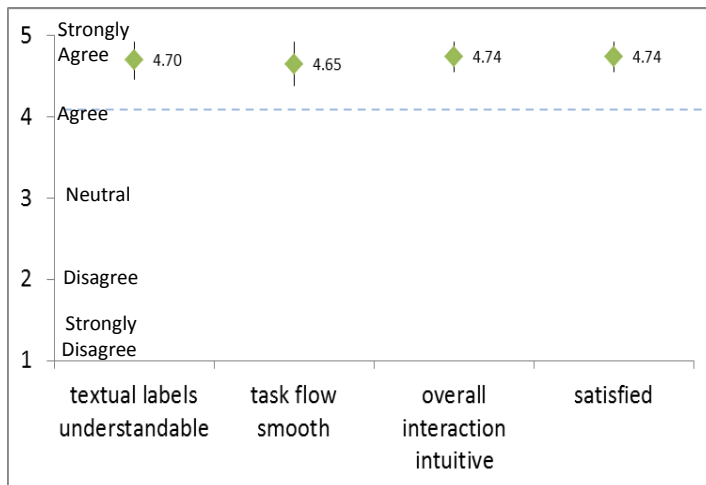

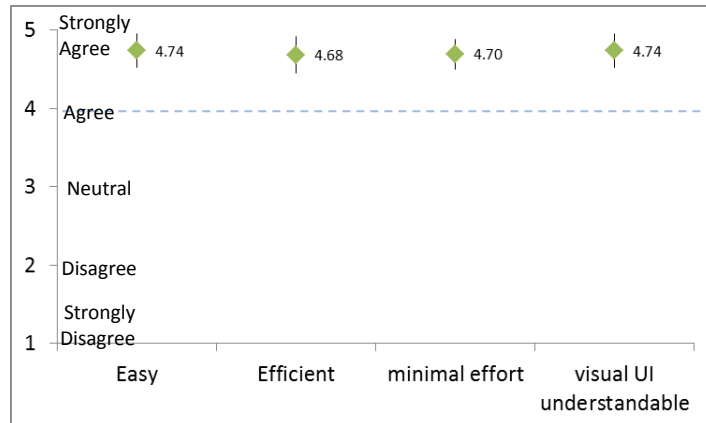

Galaxy SIII Core Product Experience

Initial Gmail Setup

Results:

Consumers find the initial setup of Gmail straightforward and easy. They are highly satisfied with the setup experience and task flow.

Gmail

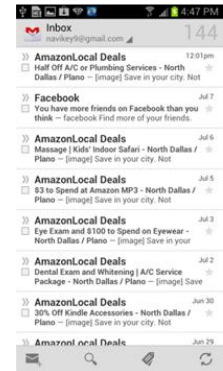

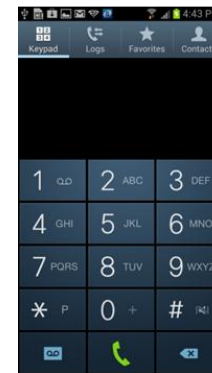

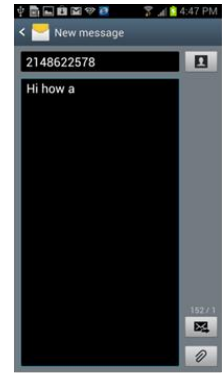

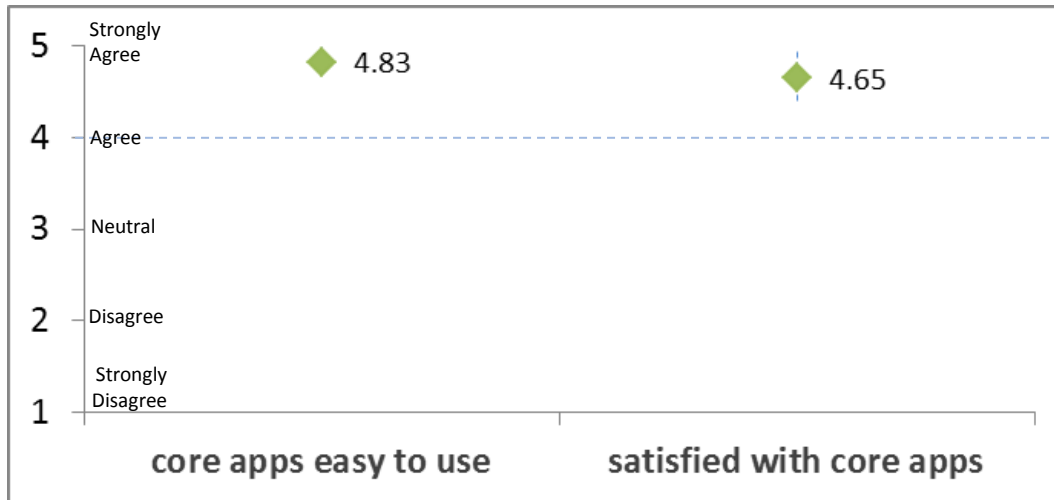

Galaxy SIII Core Product Experience

Core Apps Ease of Use and Satisfaction

Results:

Consumers are highly satisfied with the core apps (Internet, messaging, Dialer etc.) in GSIII and find them easy to use.

Galaxy SIII:
Discovery and Usage
of Differentiable Product
Experience

Galaxy SIII Differentiable Product Experience – News Ticker

Setting Up News Ticker in Locked Screen (Task Failure Rate: 74%): Overview

Results:

Consumers find the initial setup of News Ticker extremely challenging. The settings are not easily discoverable. Only 6 out of 23 could complete task within 2 minutes.

Respondents (4 out of 23) who completed this setup on first trial typically discovered the location of this setting (by “accident”) before this task when they were exploring Galaxy SIII during the core tasks.

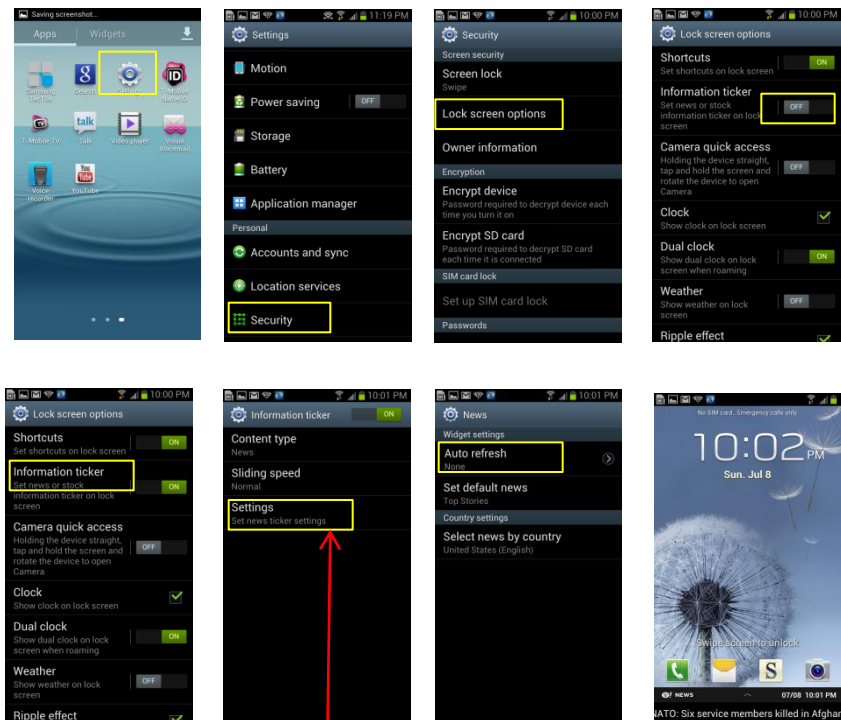

Without any previous knowledge of the location, all other respondents (19 out of 23) struggled to set up the ticker. In fact, only 2 of the 19 could complete the task within 2 minutes after different attempts. Most respondents tried multiple ways to set up News Ticker.

Some of the paths those respondents went through were:

1. Settings: Display
2. Different pages/screens of Apps and Widgets
3. Settings: Wallpaper (Live Wallpaper/News Wall)
4. Flipboard
5. Internet

Only 3 respondents (2 completed tasks successfully) thought that the “Locked Screen Options” should be under “Settings: Security”. Fourteen respondents suggested that “Locked Screen Options” should be under “Settings” directly and 4 suggested it be under “Settings: Display”. There were also 8 suggestions of using Apps or Widgets or even Internet Browser to set up the ticker because the source of news came from Yahoo/Internet.

Example user interface flow to set up Information Ticker (Detailed Interaction not included)

In order to set up the ticker correctly, the “Settings” menu within “Information Ticker” must be “initialized”. If this step is skipped, the information ticker will not be functional. This should have been initialized by default.

Galaxy SIII Differentiable Product Experience – News Ticker

Setting Up News Ticker in Locked Screen (Task Failure Rate: 74%): Navigation Paths

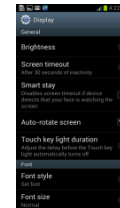

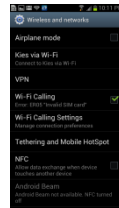

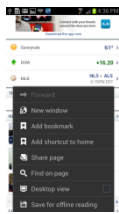

Results:

The News Ticker would not function properly even when the setting was turned on. It would need to be configured after turning on the toggle switch within Settings:Security.

❌ News Widget / Internet

❌ Settings: More Settings

❌ Settings: Display

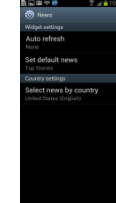

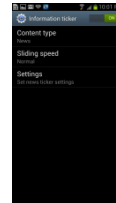

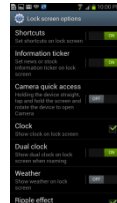

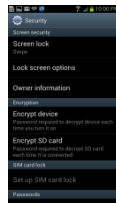

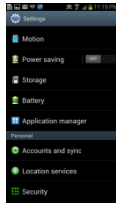

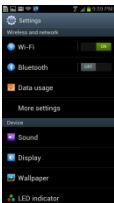

A common pitfall is the attempt to set up News Ticker from news widget or internet browser.

Some respondents went into “More Settings” under “Wireless and network” and discovered “S-Beam” setup which eventually helped them to complete S-Beam task.

“Settings: Display” is another frequently explored location to set up News Ticker

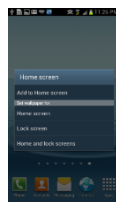

✅ Settings: Security: Locked Screen Options (with further customization)

❌ Apps and Widgets

❌ Locked Screen Wallpaper

❌ On but w/o further customization

The number of apps and widgets are overwhelming for users to guess (e.g., 50 apps in 3 pages and 53 widgets 9 pages).

Locked Screen Wallpaper is an area some users would go and try to set up.

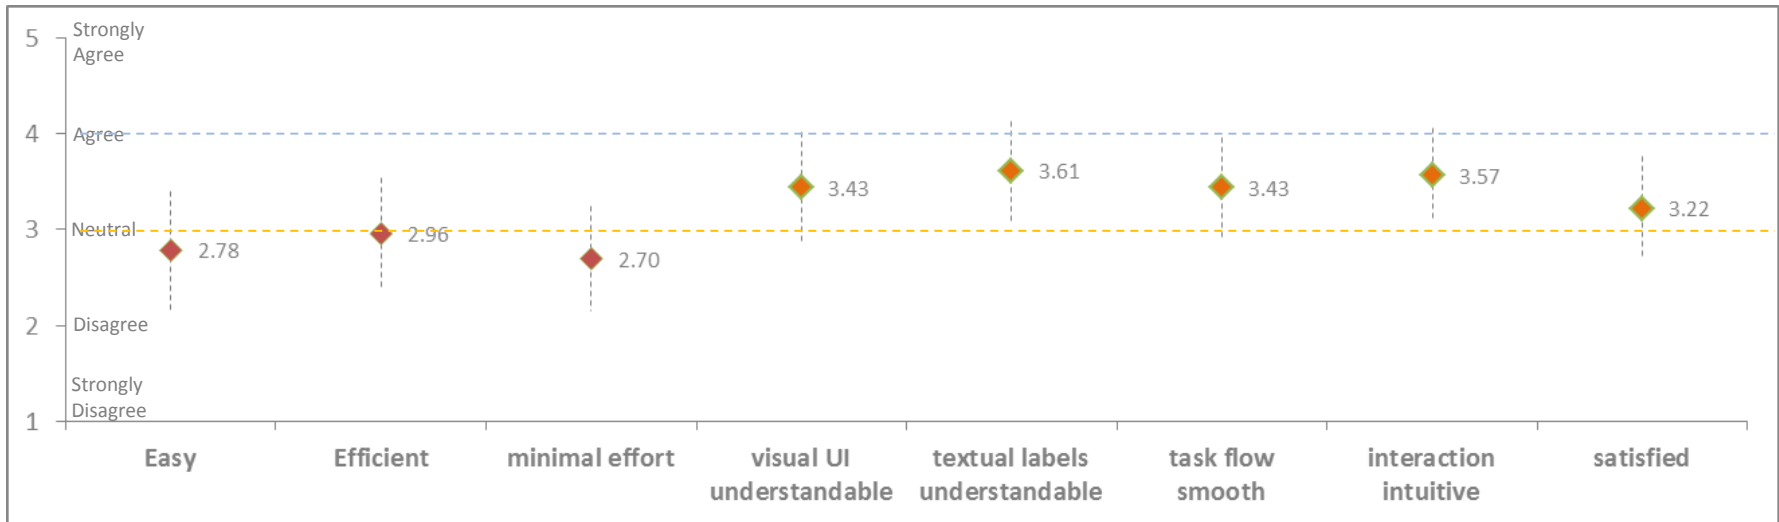

The news ticker cannot be configured successfully through locked screen if user does not set up the details of news ticker after turning it on in “Security” Settings.

Galaxy SIII Differentiable Product Experience – News Ticker

Setting Up News Ticker in Locked Screen (Task Failure Rate: 74%): Usability and Satisfaction

Results:

The usability and satisfaction scores were well below agreeable level to the consumers. Recommended design suggestions include moving the Locked Screen Options to a more visible location under “Settings” and developing a setup app or widget for customization of key features.

The overall experience of setting up the ticker was frustrating for most respondents. They made multiple attempts, using different strategies searching for the settings. Since there were a large number of apps, widgets, options and settings, they usually looked through the items exhaustively to identify likely candidates and explore those candidates one by one.

Most of the respondents would not associate locked screen with “Security” and missed exploring this setting menu.

Design Suggestions from Respondents and Observations:

1. A setup app or widget should be included as default to allow users customize the key core and differentiable features of the product. It should be part of the out of box experience and can be invoked any time afterwards.
2. The “Locked Screen Options” can be moved from Settings: Security to more intuitive location in the Settings menu. One alternative is to put this directly under “Settings” or under “Display”.

Galaxy SIII Differentiable Product Experience – S Beam

Setting Up (Task Failure Rate: 35%) & Using S Beam: Overview

Results:

Consumers find the initial setup of S Beam challenging. Eight out of 23 could not complete task within 2 minutes. Another eight could only complete the task with multiple trials. The task failure rate could have been higher if “Wireless and network: More settings” was not visible from the first screen of the Settings. After setting it up, S-Beam is relatively easy to use with minor usability issues.

Respondents (7 out of 23) who completed this setup on first trial typically discovered the location of this setting (by “accident”) before this task when they were exploring Galaxy SIII during the core tasks or when they were searching for Information Ticker settings in previous task. (Note: This task was swapped with the Information Ticker task from the 5th session through the end of the research as the first task instead).

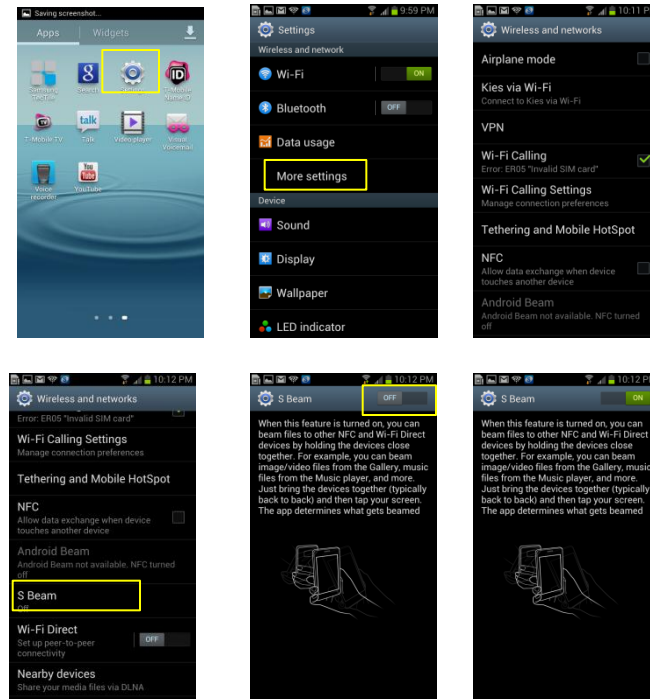

Out of 23 respondents, 15 of them could complete the task within 2 minutes after they discovered the S Beam setting was in “More Settings” before or during the task.

The typical paths those respondents went through were:

1. Camera
2. Different pages/screens of Apps and Widgets for “S Beam” app or Widget
3. S Voice

A few respondents thought that S Beam could be enabled in the camera app before they took pictures and shared with another device. Some respondents would look for a S Beam app or widget in home screens and in the Apps screens. The new Galaxy SIII owner who happened to participate in the research tried to use S Voice to enable S beam.

Example User interface flow to set up S Beam (Detailed Interaction not included)

Galaxy SIII Differentiable Product Experience – S Beam

Setting Up S Beam (Task Failure Rate: 35%): Navigation Paths

Results:

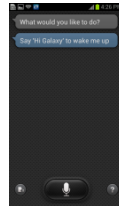

Consumers do not intuitively associate turning on S Beam in the “Wireless and network: More settings” unless they have previous exposure /knowledge of its location. They tend to go first into Apps and Widgets or the camera settings to turn on S Beam.

❌ Camera Settings

Camera settings were explored by a number of respondents as the location where S Beam could be turned on.

❌ S Voice

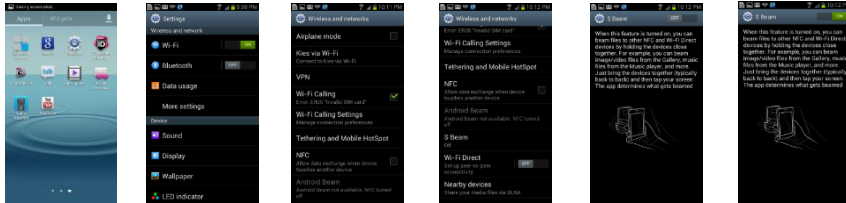

❌ Search

Many consumers used Google Search in many set up tasks because they expected that search could help to locate phone features as stipulated in the initial cue of the capability offered by Search. .

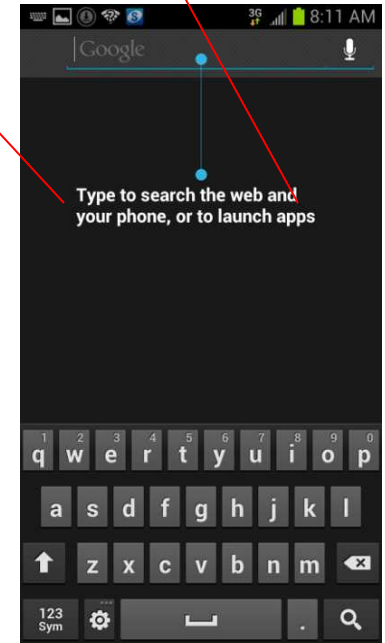

✅ Settings: Wireless and networks: More settings: S Beam

❌ Apps and Widgets

Respondents usually dismissed this path after they could not locate S Beam app or widget or use “Search” to locate S Beam

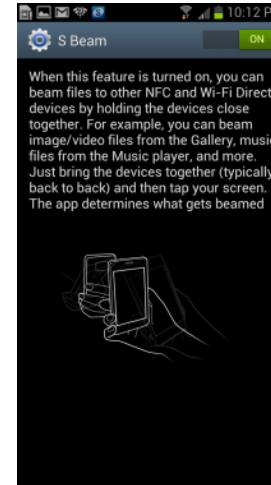

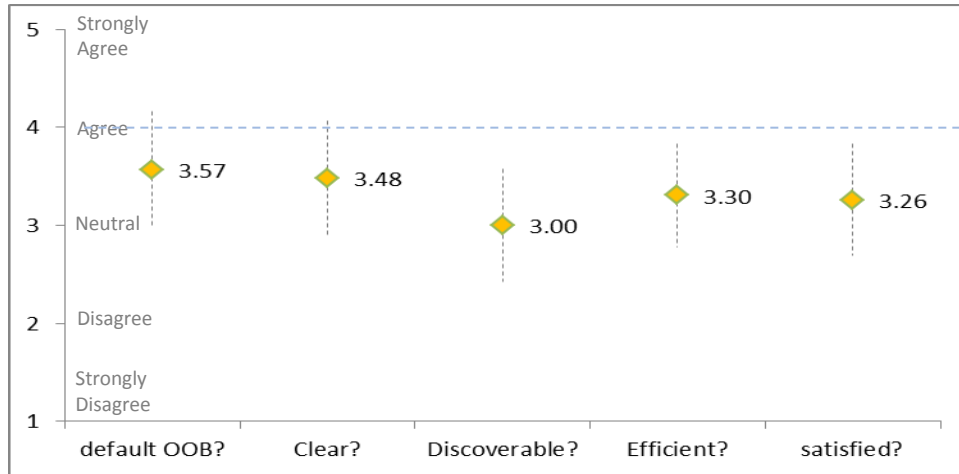

Galaxy SIII Differentiable Product Experience – S Beam

Setting Up S Beam (Task Failure Rate: 35%): Usability & Satisfaction

Results:

Consumers have some difficulties in discovering how S Beam can be set up.

The overall experience of setting up S Beam was frustrating for some respondents. They made multiple attempts, using different strategies searching for the settings. They did not associate S Beam with “Wireless and network” settings at first. Some respondents were successful in completing the task not because they made the right guess of the location. They were successful because “More settings” was relatively visible in the Settings app and was among the first areas they explored.

Design Suggestions from Respondents and Observations:

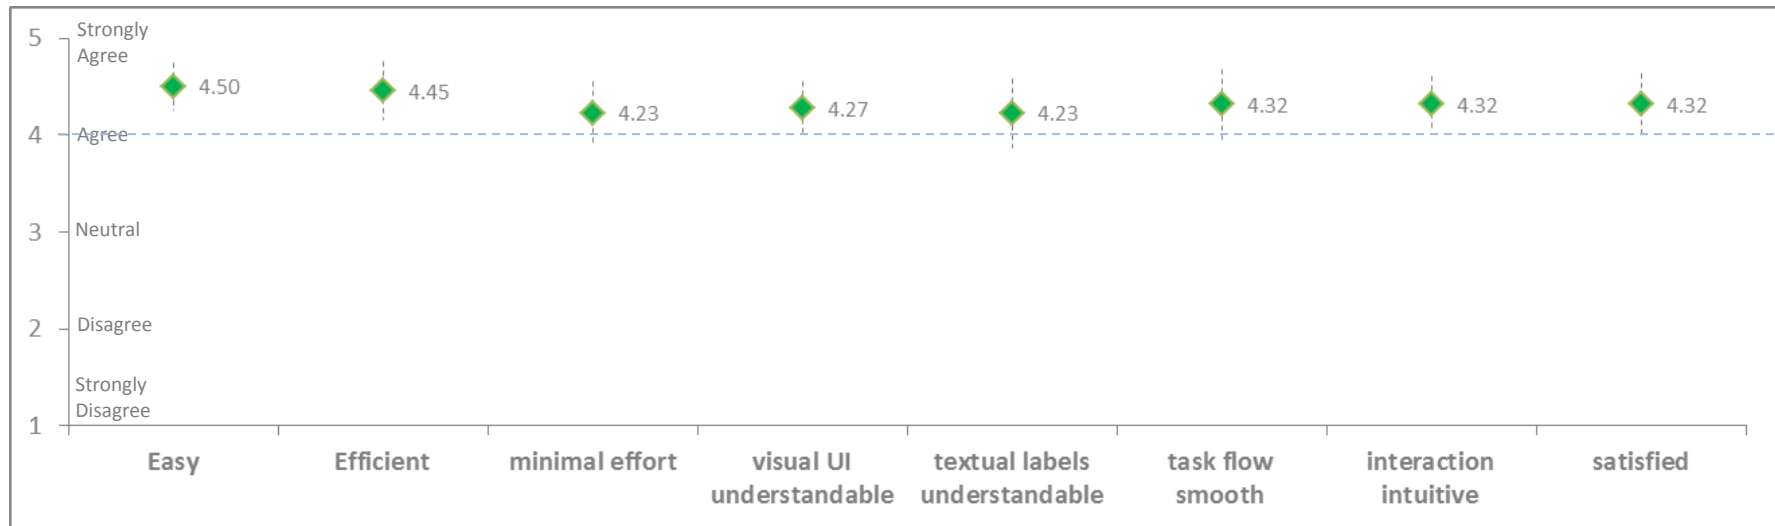

1. A setup app or widget should be included as default to allow users customize the key differentiable features of the product. It should be part of the out of box experience and can be invoked any time afterwards.
2. Out-of-Box support for S Beam (default on) is an alternative approach that can improve the initial usage experience of S Beam.
3. The Search application should include the differentiable features of the device so that users can set those features up and use them from Search.

Galaxy SIII Differentiable Product Experience – S Beam

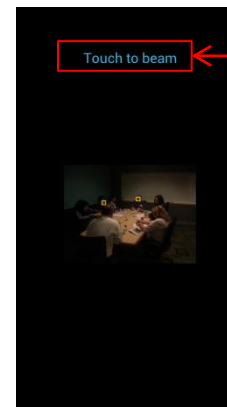

Using S Beam: Usability & Satisfaction

Results:

Consumers find using S Beam easy and straightforward except for some minor difficulties in the instruction cue “Touch to beam” where respondents tried to touch the label instead of the object (e.g., photo) to initiate beaming and infrequent Wi-Fi direct connection issues.*

The overall experience of using S Beam was relatively satisfying and smooth. Respondents enjoyed the experience and the speed of transmission. There were some minor usability issues such as the one described on the right. The Wi-Fi Direct connection also did not establish in some of the trials and the task had to be repeated.

One minor usability problem was the textual label of “Touch to beam” – many respondents would tap on the textual label itself multiple times, only finding that it did not respond and the connection timed out.

Galaxy SIII Differentiable Product Experience – Voice Commands to take Pictures

Enabling (Task Failure Rate: 61%) and using Voice Commands to take pictures : Overview

Results:

Consumers find the initial setup of voice commands to take pictures very challenging. Most consumers would try to turn on voice commands within the camera app settings. Fourteen out of 23 could not complete task within 2 minutes.

Out of the 9 respondents (9 out of 23) who completed this setup, only 2 completed the task with first trial. They discovered the setting before this task when they were exploring Galaxy SIII during the core tasks or previous tasks.

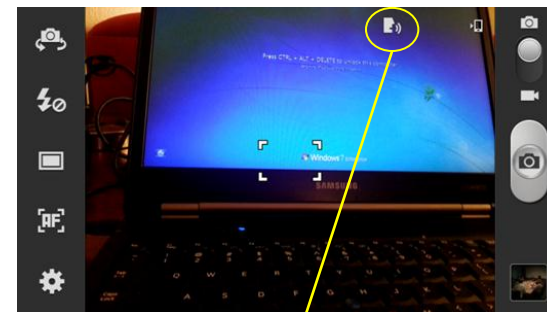

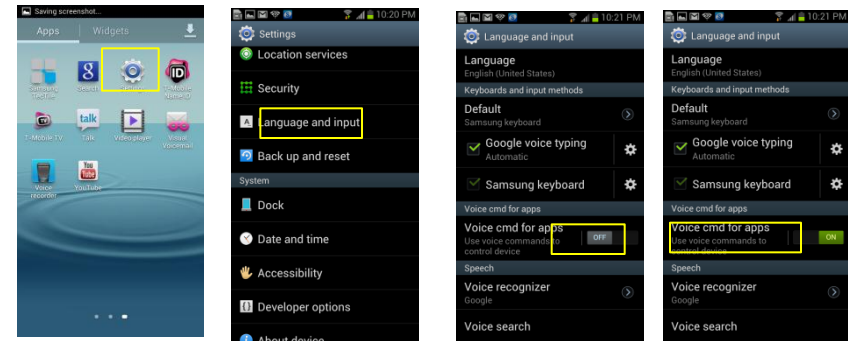

Out of 23 respondents, 14 of them could not complete the task within 2 minutes. The typical paths those respondents went through were:

1. Camera Settings
2. Settings: Sounds
3. Settings: Accessibility
4. S-Voice

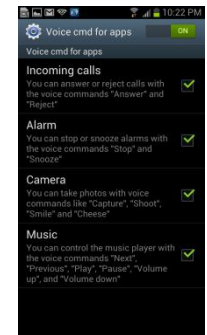

Most respondents thought that the setting of enabling voice commands in camera should be accessible and controlled from the camera settings. A few respondents went into S-Voice and attempted to turn it on through voice.

Using voice commands to take pictures were straightforward. It did not work consistently though, especially immediately after enabling it. If the camera was left on, it might snap pictures randomly during conversations.

Example User interface flow to set up Voice Commands to take Pictures (Detailed Interaction not included)

Voice command icon visible when enabled

Galaxy SIII Differentiable Product Experience –Voice Commands to take Pictures

Enabling Voice Commands to take Pictures (Task Failure Rate: 61%)

Results:

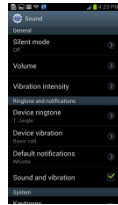

Camera Settings were explored by most respondents first, followed by Sound and Accessibility settings. It was difficult for consumers to intuitively search under “Language and input” for this setting.

❌ Camera: Settings

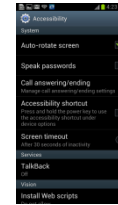

Camera settings were explored as the likely location where voice commands to take picture could be turned on.

❌ Settings: Sound

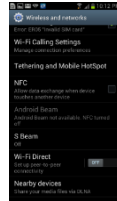

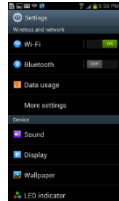

❌ Settings: Accessibility

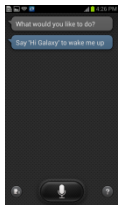

Accessibility was one of the popular locations as voice support, text-to-speech features (e.g., Talkback in Android) could be enabled.

✅ Settings: Language and input: Voice cmd for apps

❌ S Voice

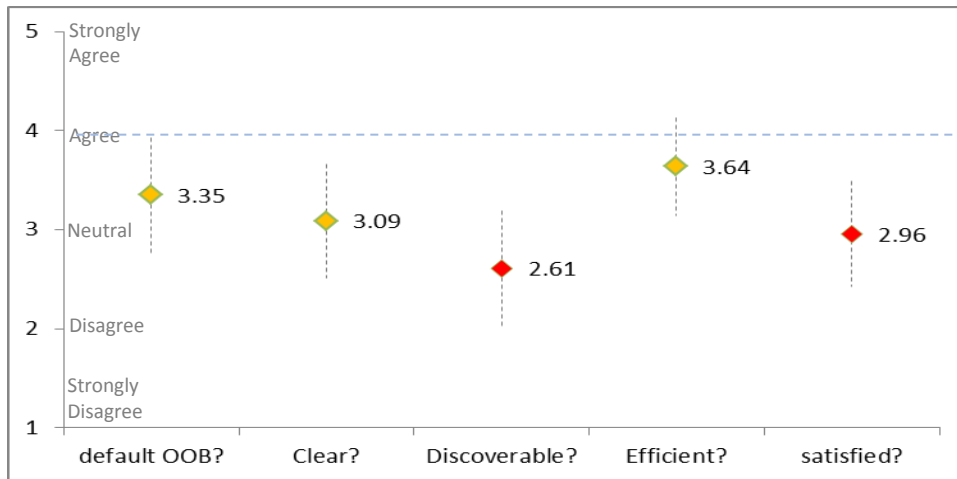

Respondents tried to take picture using S Voice.

Galaxy SIII Differentiable Product Experience – Voice Commands to take Pictures

Enabling Voice Commands to take Pictures (Task Failure Rate: 61%): Usability & Satisfaction

Results:

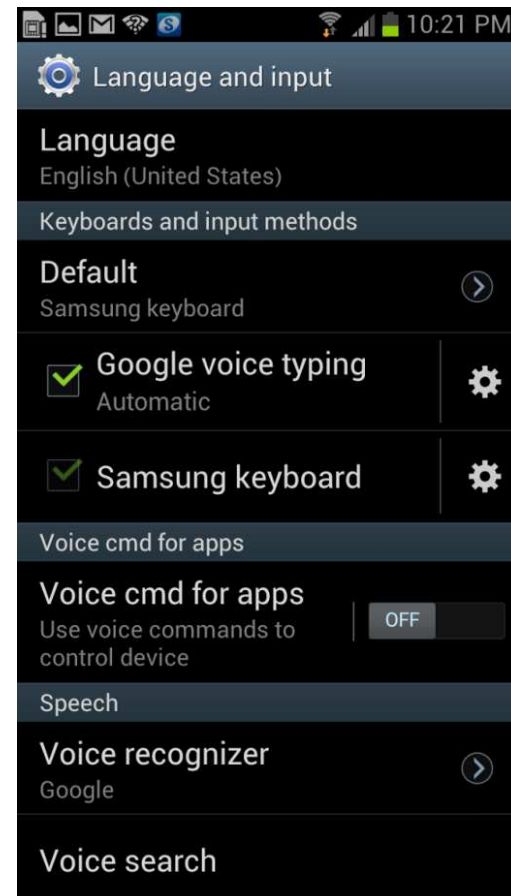

Consumers have great difficulties in associating the setting to enable voice command to take picture to be classified under “Language and input”.

The overall experience of setting up Voice Commands to take pictures was frustrating for most respondents. Many of them made multiple attempts, using different strategies searching for the settings, especially within the camera app. Some searched through camera settings repeatedly.

They also tried Sounds Settings and Accessibility Settings. For those completed the tasks, they did it mostly through trial and error.

Respondents did not necessarily want this to be enabled by default as it might be difficult to anticipate whether voice commands are reliable in different circumstances.

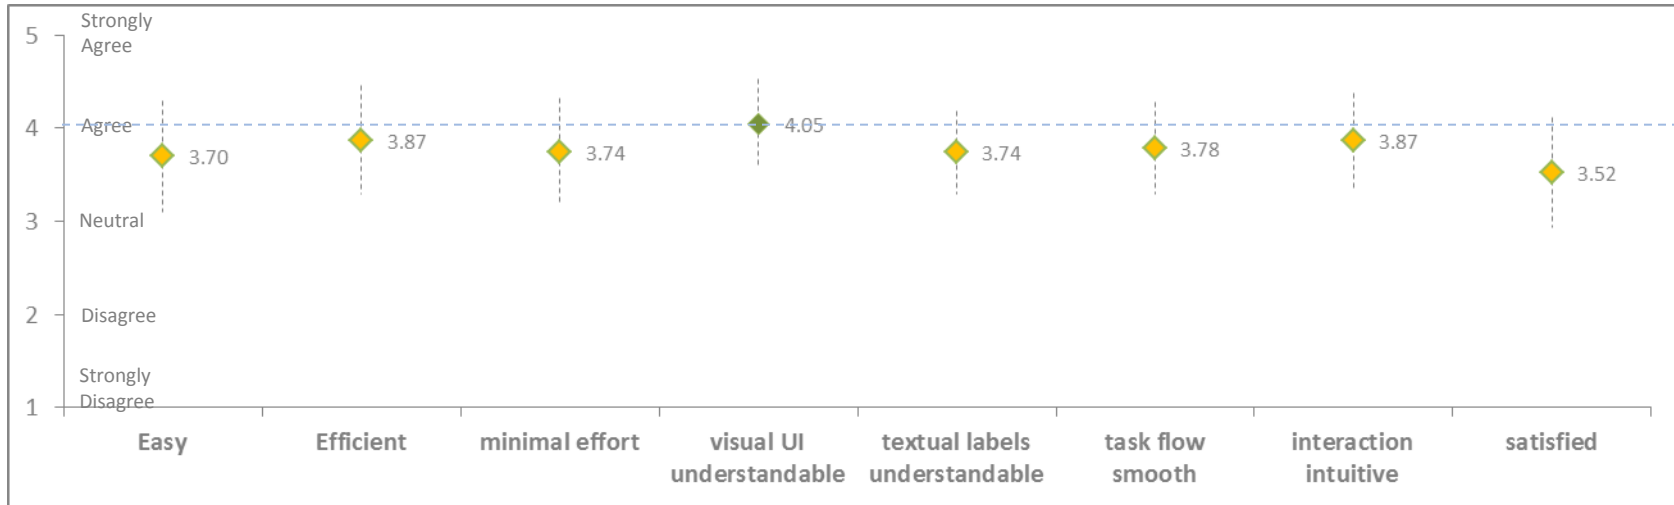

Galaxy SIII Differentiable Product Experience – Using Voice Commands to take Pictures

Using Voice Commands to take Pictures: Usability & Satisfaction

Results:

There were frequent functional problems throughout the sessions where voice command to take picture did not work after it was enabled. There was no consistent patterns observed, though at one time it was suspected that Wi-Fi Direct might have been the culprit.

The overall experience of using voice command was straightforward but it may not work consistently. Some of the “undocumented” keywords (e.g., “Take Pictures”) seemed to work at times. In some of the sessions, voice commands did not work at all with the documented keywords after it was enabled. In other sessions, the camera might snap pictures randomly when respondents or moderator talked.

Design Suggestions from Respondents and Observations:

1. The setting should be accessible and controlled from within the camera settings..

Galaxy SIII Differentiable Product Experience – Editing Shortcut of Camera Menu

Editing Shortcut of Camera App: Overview

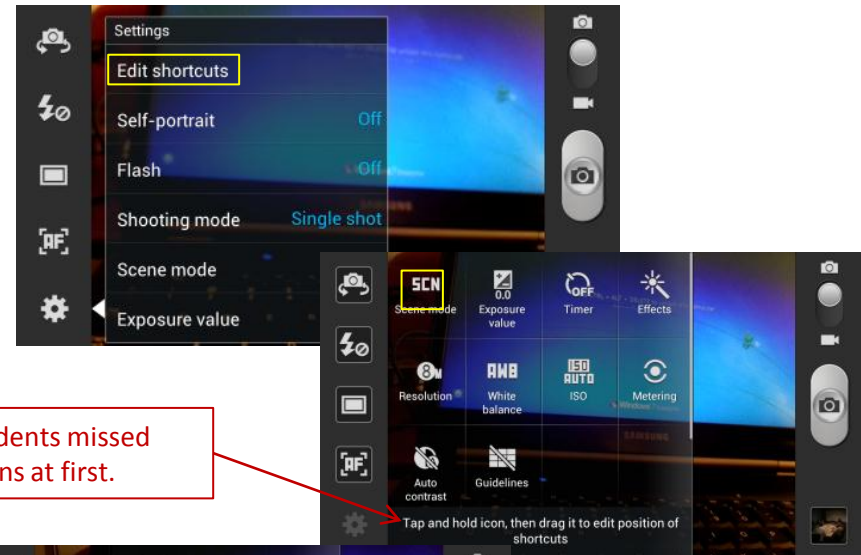

Results:

Consumers find it relatively easy to edit camera shortcut and customize the camera shortcut menu. No major usability issues were identified for this task.

Most respondents (22 out of 23) completed the task without much problems. Minor problems a few respondents encountered included missing the instruction at the bottom of the display “Tap and hold icon, then drag it to edit position of shortcuts”.

Example User interface flow to edit camera shortcut
(Detailed Interaction not included)

Some respondents missed the instructions at first.

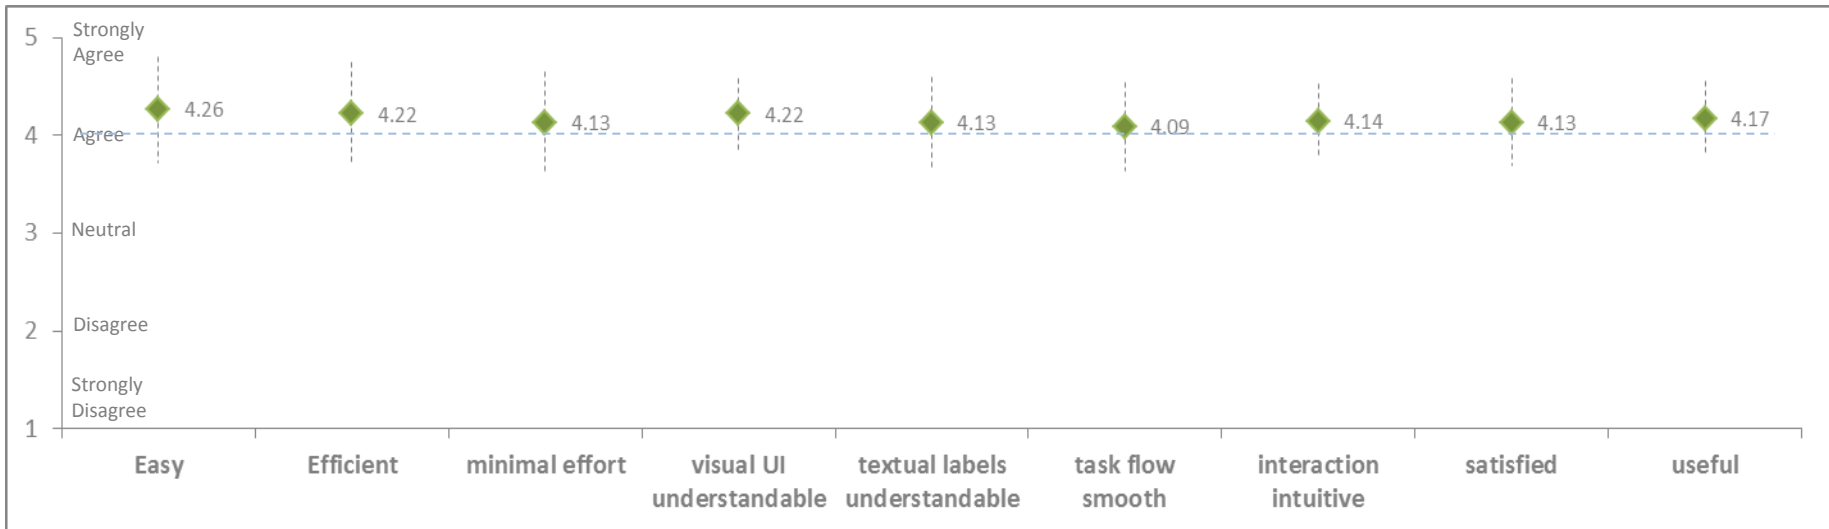

Galaxy SIII Differentiable Product Experience – Editing Shortcut of camera menu

Editing Shortcut of Camera Menu: Usability and Satisfaction

Results:

The usability and satisfaction scores were agreeable. No major usability issues were observed during the session.

The overall experience of editing shortcut was satisfying for most respondents. A few respondents missed the instructions on the display to edit shortcut at first but eventually came to complete the task.

Galaxy SIII Differentiable Product Experience – Share Shot

Share Shot : Overview

Results:

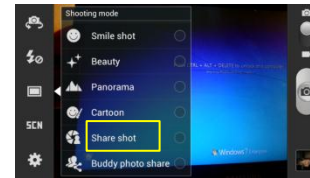

Consumers find invocation of Share Shot challenging. Twelve out of 23 could not find where to initiate Share shot within 2 minutes. Once the function was invoked, the task was relatively straightforward to follow through step by step with good completion rate.

Only 5 respondents (5 out of 23) could find Share Shot directly from the Modes in Camera Shortcut menu right away. They were able to scroll down the list of options and locate Share Shot towards the end of the list. The other 6 could only complete the task with multiple attempts within 2 minutes.

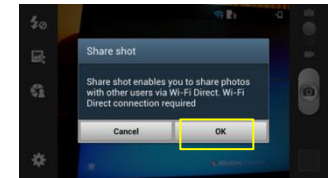

Once the initial invocation of Share shot was through, respondents did not have major usability issues with the flow of the application to use shared shots. The purpose of the feature to change the device name or profile might not be immediately clear to the respondents (this feature was not necessary to use Share shot) but most of the respondents could complete this step without much problems

The subsequent flow of taking pictures was easy and routine. Some respondents had difficulties in finding where the “shared pictures” were located. Three respondents could not find “sharedShot Pictures” as they kept accessing the camera folder under Gallery through the camera app only and did not discover SharedShot pictures were in Gallery. They were not aware of receiving shared pictures notifications. Out of the 23 respondents, 9 could find location of SharedShot pictures right away in Gallery.

Galaxy SIII Differentiable Product Experience – Share Shot

Finding Share Shot (Task Failure Rate: 52%): Usability & Satisfaction

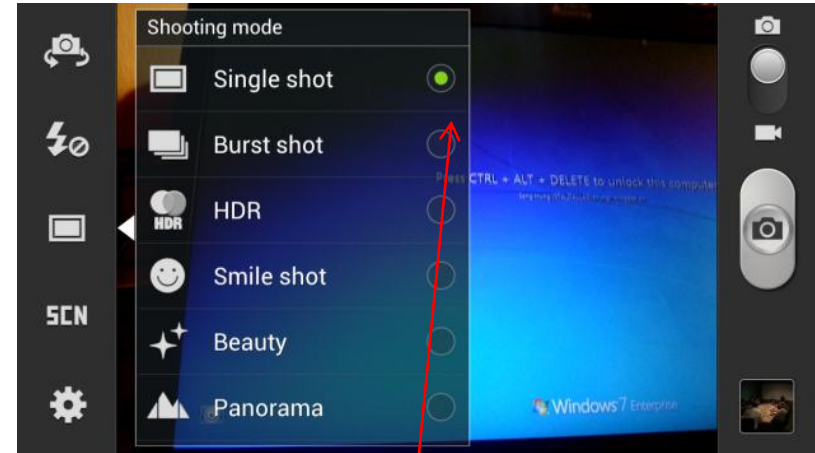

Results:

Consumers have numerous difficulties in discovering how Share shot can be invoked.

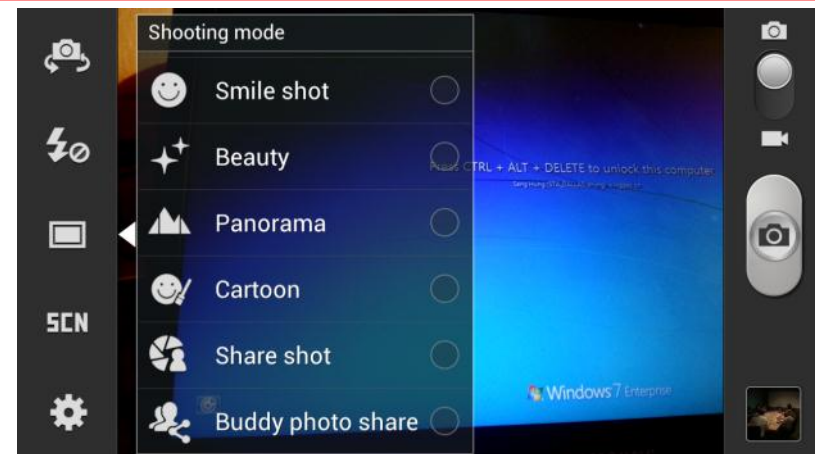

The overall experience of setting up Share shot was frustrating for many respondents. Although most of the respondents reached the menu options in the camera containing Share shot, they were not aware that the options were scrollable and moved on to explore other possibilities. The scroll bar of “Shooting mode” timed out very quickly when the menu was assessed and many respondents missed it.

They made multiple attempts, using different strategies searching for the settings. Since there were a large number of apps, widgets, options and settings, they usually looked through the items exhaustively to identify likely candidates and explore those candidates one by one.

Feature discovery problem of Shared shot: the option was hidden under Shooting mode and the scroll bar disappeared quickly after the shooting mode button was hit and many respondents were not aware of additional items.

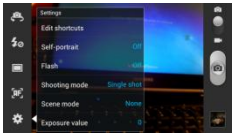

Galaxy SIII Differentiable Product Experience – Share Shot

Finding Share Shot (Task Failure Rate: 52%)

Results:

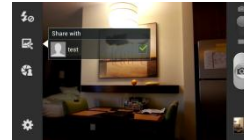

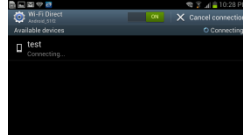

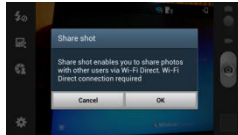

Share shot was difficult to find because it was not visible and there was no persistent cue for additional items not visible on the first screenful of options, even when respondents navigated to the right area. Some respondents thought Share shot would be set up through file sharing under Nearby devices.

❌ Camera Shortcut: Settings

Camera settings were explored by a number of respondents as the location where Shared Shot could be turned on.

✅ Camera Shortcut: Shooting Mode

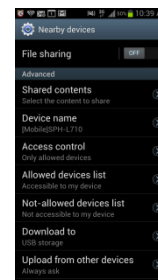

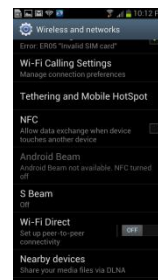

❌ Apps and Widgets

Respondents usually dismissed this path after they could not locate Shared Shot app or widget.

❌ Settings: Wireless and network: More settings: Nearby devices: File sharing

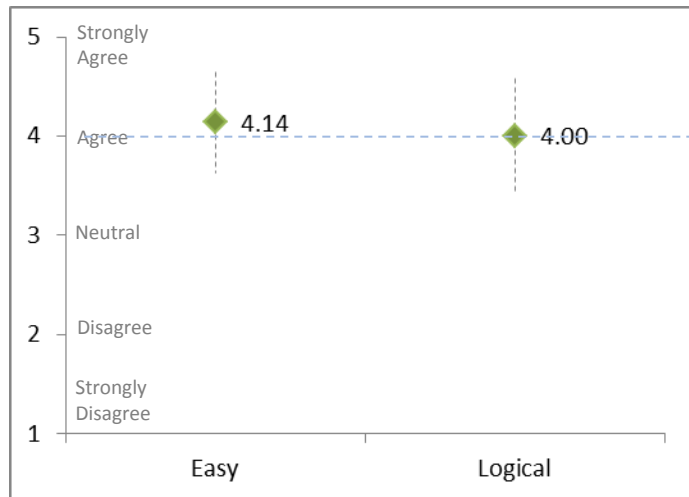

File sharing under Nearby devices in Wireless and network was thought by a few respondents as the place where Shared shot could be turned on.

Galaxy SIII Differentiable Product Experience – Share Shot

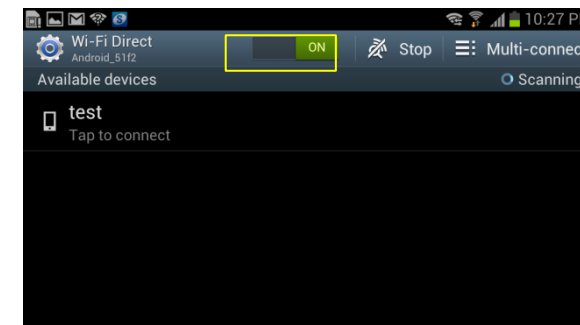

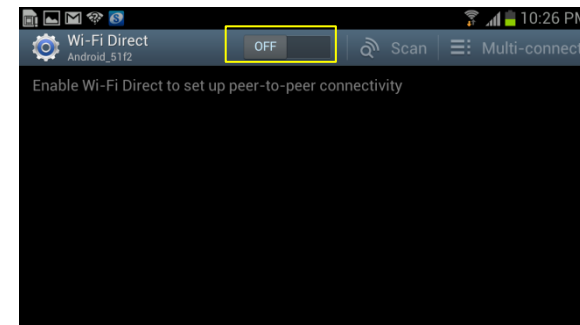

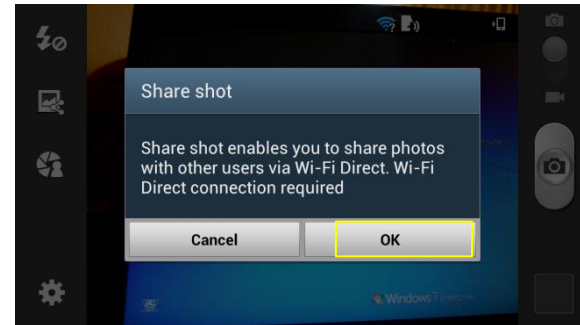

Turning on Wi-Fi Direct (Task Failure Rate: 4%): Usability & Satisfaction

Results:

Consumers have no major usability issues turning on Wi-Fi Direct during the Share shot setup process.

The overall experience of turning on Wi-Fi Direct is easy and logical without major usability issues. Respondents might not understand what Wi-Fi Direct can do but they were able to follow through the flow of the user interface.

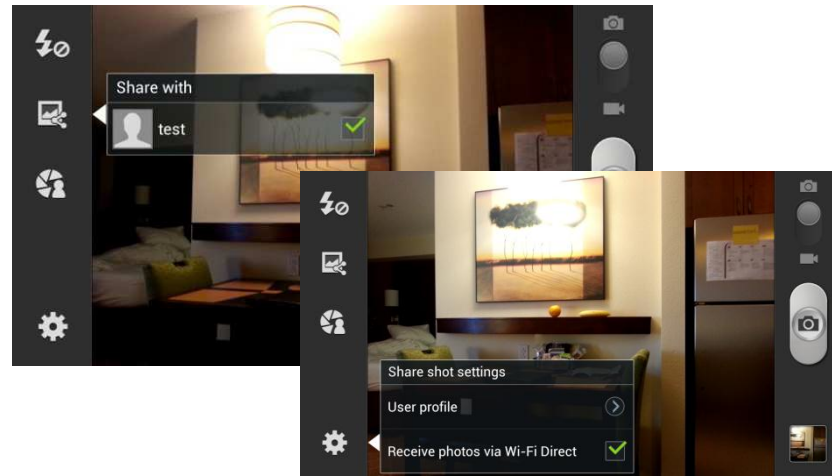

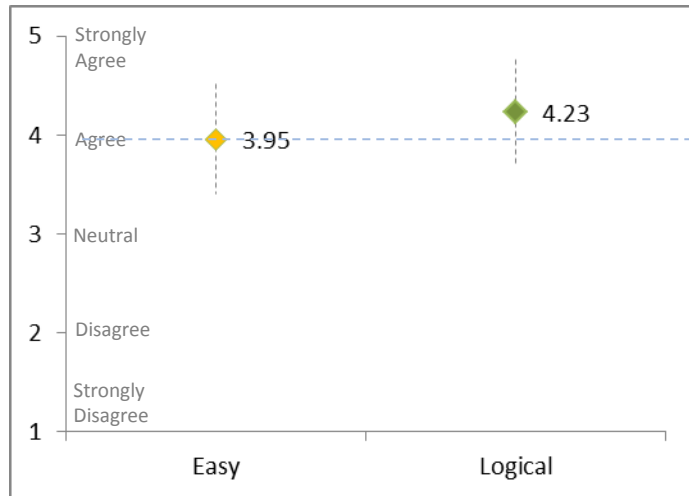

Galaxy SIII Differentiable Product Experience – Share Shot

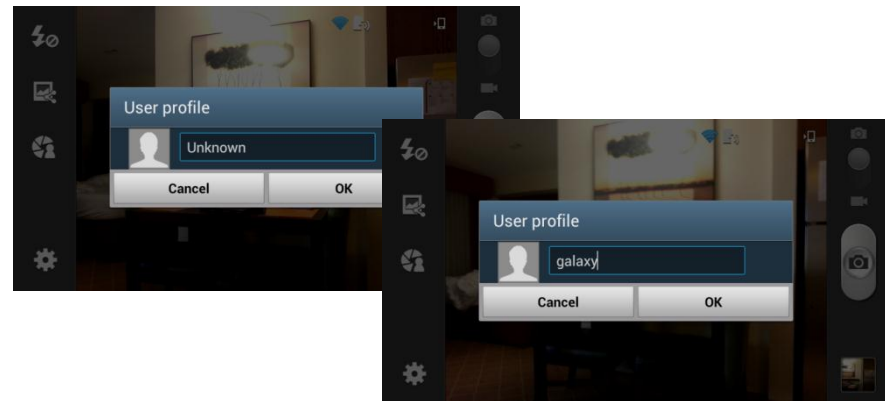

Changing Device name or User Profile (Task Failure Rate: 9%): Usability & Satisfaction

Results:

Consumers do not have major usability issues changing device name or user profile. Two of the respondents could not complete the task as they strayed away from the Shared shot screen to Settings instead.

The overall experience of changing device name or user profile was relatively straightforward. Device name option was a bit difficult to discover because it was accessible only by tapping on the menu capacitive button which tended to be used by respondents much less often than onscreen touch buttons.

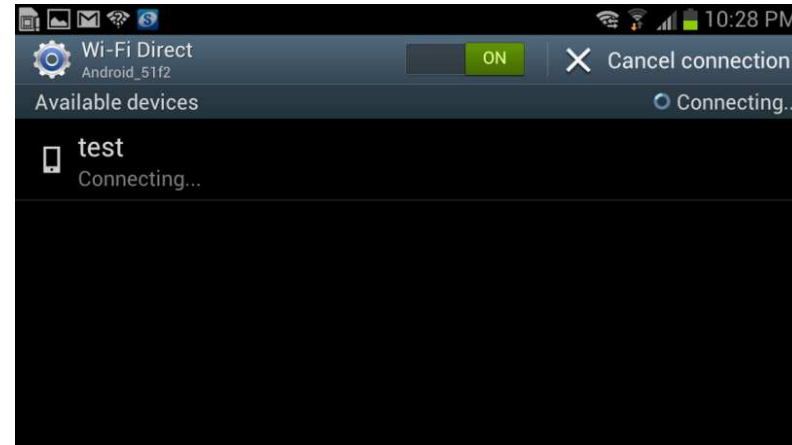

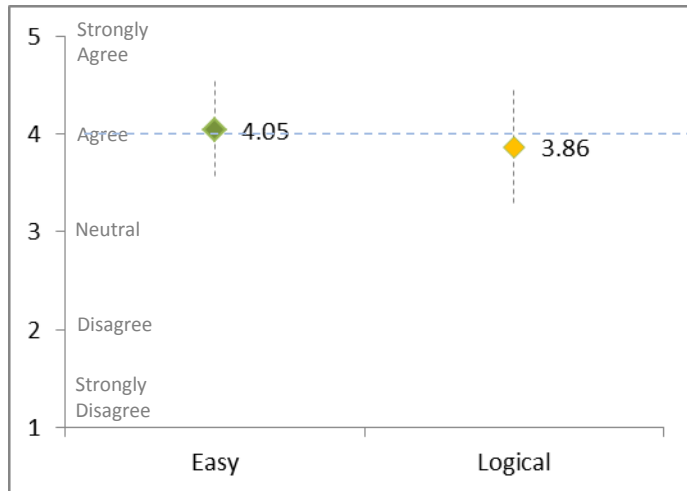

Galaxy SIII Differentiable Product Experience – Share Shot

Connect with Device Test (Task Failure Rate: 4%): Usability & Satisfaction

Results:

Consumers have no major problem of connecting to another device to share shots or accepting connections with notifications.

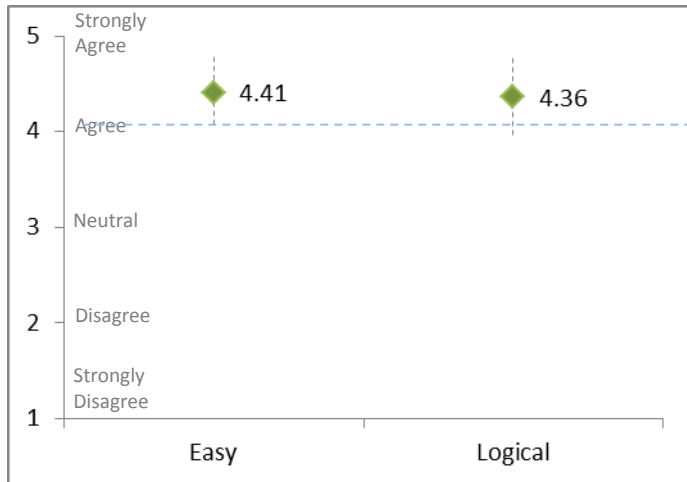

The overall experience of connecting to another device for shared shot was easy and logical. There was no major usability issues identified. The failure was a functional issue at the time of testing.

Galaxy SIII Differentiable Product Experience – Share Shot

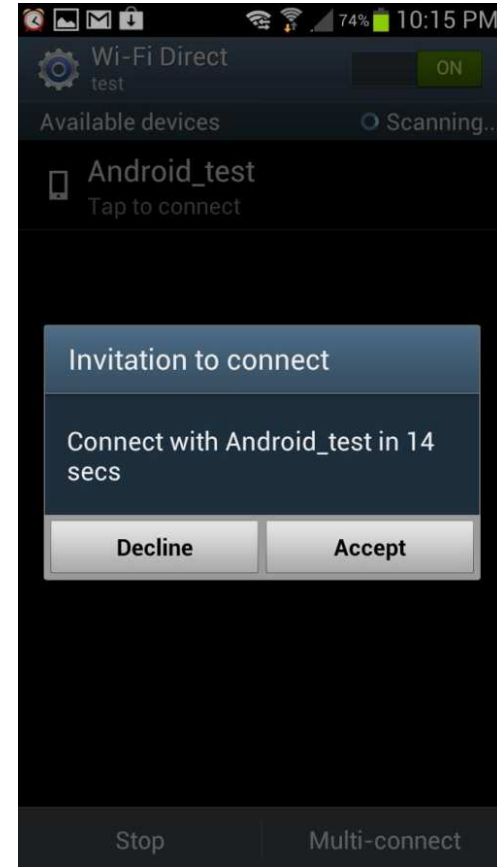

Accepting Connections (Task Failure Rate: 0%): Usability & Satisfaction

Results:

Consumers have no problems in accepting connections from another device (“Test”) in Shared shot. The pop-up notification was clear and understandable.

No usability issues were found during the testing.

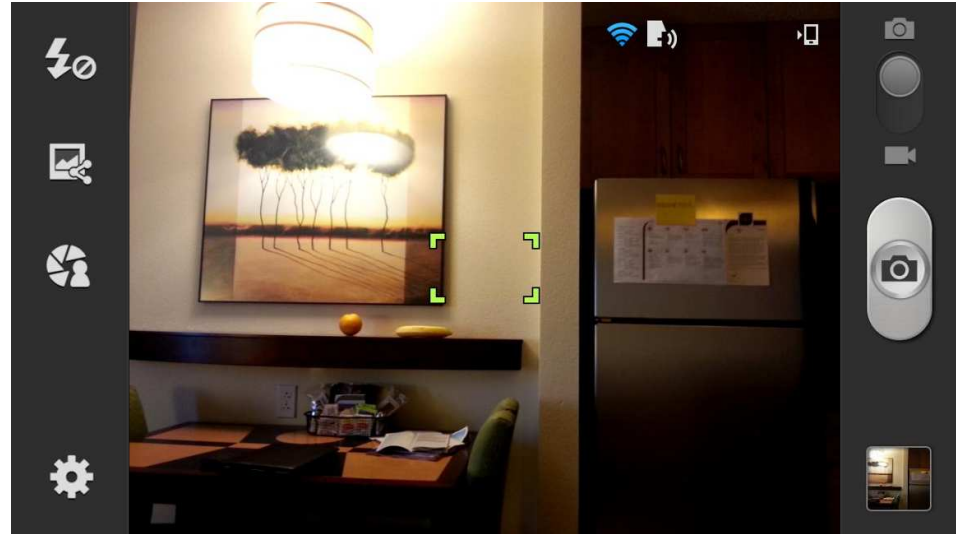

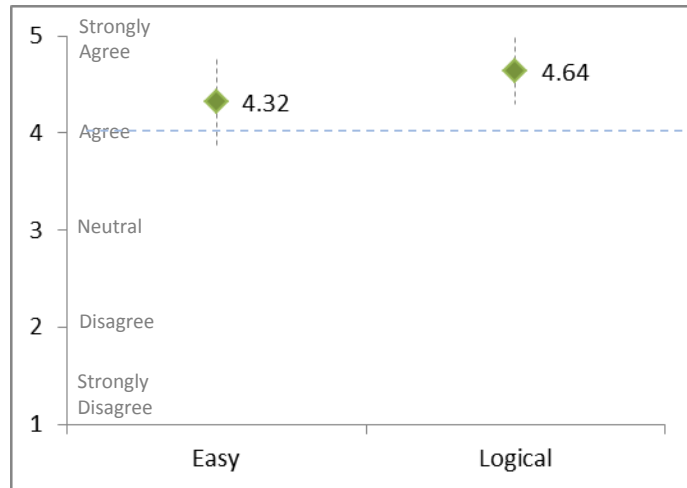

Galaxy SIII Differentiable Product Experience – Share Shot

Taking Pictures with Share Shot (Task Failure Rate: 0%): Usability & Satisfaction

Results:

Consumers have no usability problems in taking Shared shot pictures.

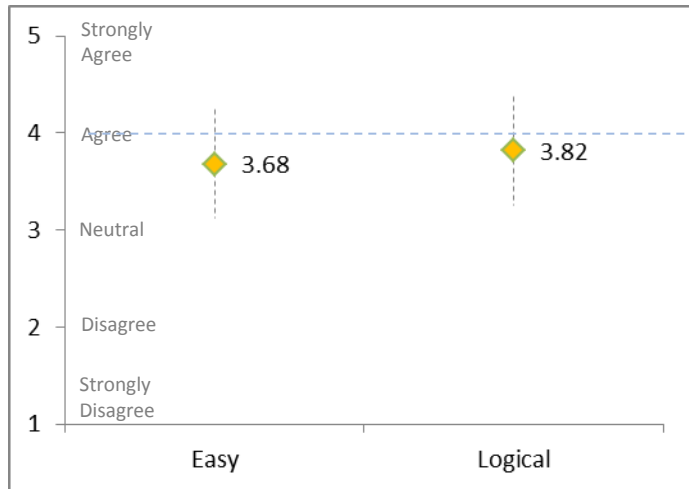

The overall experience of taking pictures in Shared shot mode is easy and logical, similar to the experience of taking regular pictures. No usability issues were uncovered during the testing.

Galaxy SIII Differentiable Product Experience – Share Shot

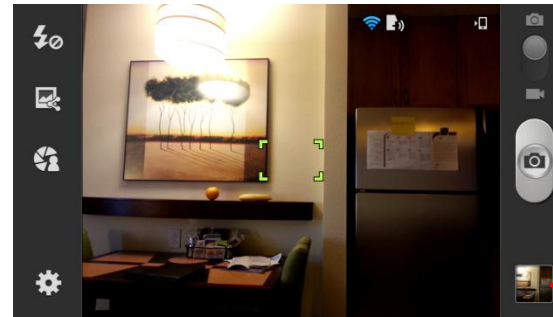

Finding Shared Pictures (Task Failure Rate: 13%): Usability & Satisfaction

Results:

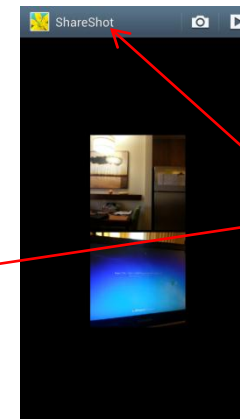

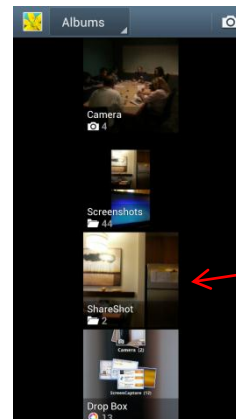

Some consumers have difficulties in locating SharedShot pictures. They repeatedly tried to find the pictures taken by their own camera through the camera app itself and failed to find SharedShot pictures under Gallery.

The overall experience of locating Sharedshot was a bit difficult for many respondents as most of them tried to access the pictures in the camera through the camera app instead. Eventually, most respondents (except 3) found Shared shots in the Gallery app.

Many respondents started with accessing the pictures taken by the camera through the camera app itself.

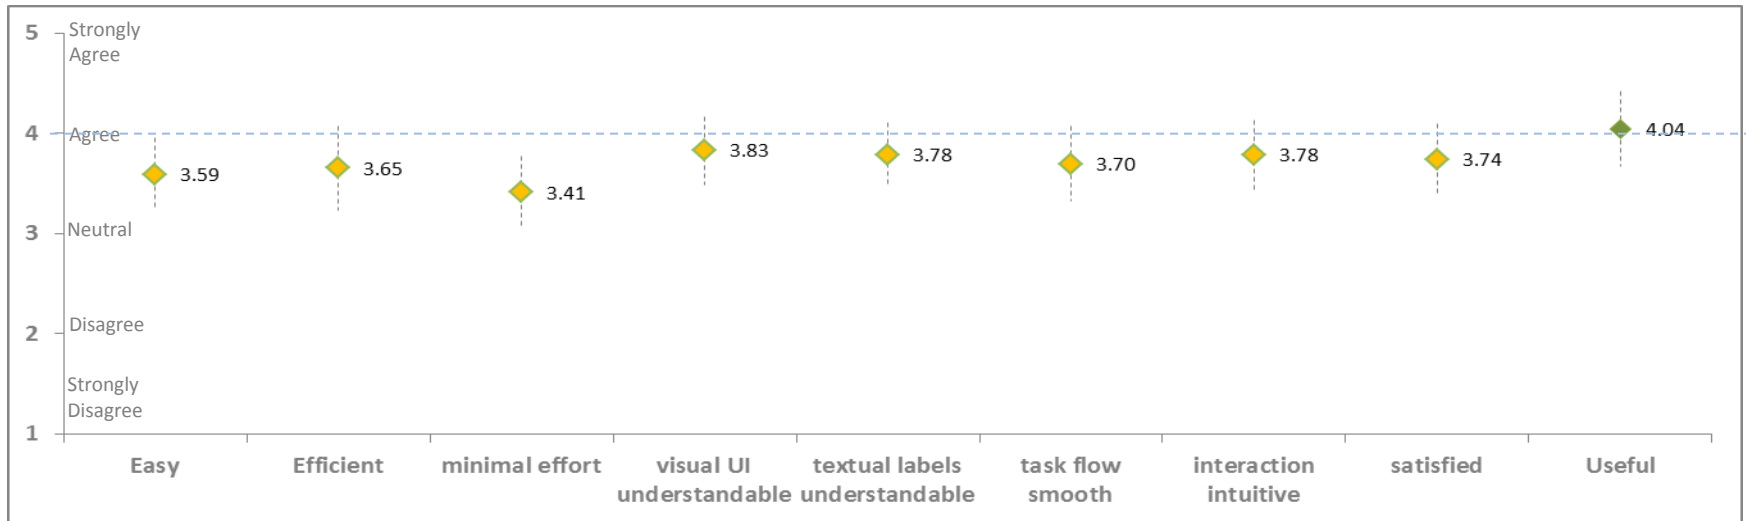

SharedShot folder can only accessed through Gallery..

Galaxy SIII Differentiable Product Experience – Share Shot

Overall Experience: Usability & Satisfaction

Results:
Consumers reactions to the overall experience of Shared Shot were mixed because of the initial feature discoverability issues.

The overall experience of using Share Shot was mixed. The discoverability issue and the relative complexity of the feature was not easy for consumers to learn and set up the task without step-by-step guidance.

Design Suggestions from Respondents and Observations:

1. A widget to help consumers setting up Share Shot is helpful so that they will not fumble to find the feature within the camera when needed.
2. A persistent cue to denote more options available should be used in scrollable menu having additional screenful of options.

Galaxy SIII Differentiable Product Experience – AllShare Play Photo Streaming to PC

AllShare Play Photo Streaming: Overview

Results:

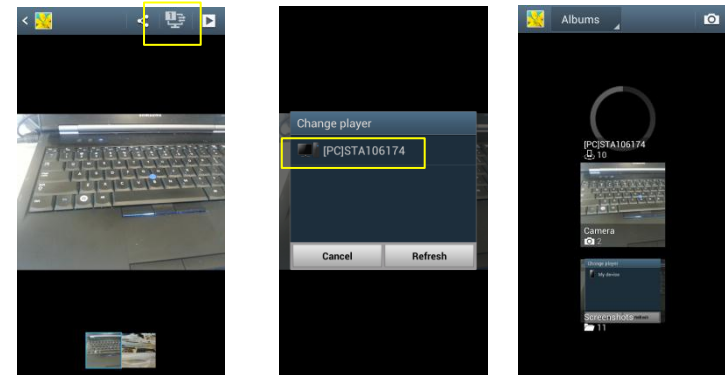

Consumers find AllShare Play Photo Streaming to PC relatively easy once they found the onscreen iconic button to stream to other AllShare devices. Finding or understanding the meaning of the icon seemed to be problematic with a number of consumers with less than half respondents recognized or remembered the icon on their first trial.

Although the task was structured in a way that mirrored the sales demonstration, four respondents could not complete the task because they could not identify or missed the onscreen button to launch photo streaming to a PC with AllShare app/client running in the background. Less than half of the respondents could recognize or remember the icon on first trial.

Once the icon was identified, the steps were easy to follow through.

Note: Only 21 respondents went through this task because of connection problems during one of the sessions and the task had to be dropped because of time constraint.

Example User interface flow to invoke Share Shot
(Detailed Interaction not included)

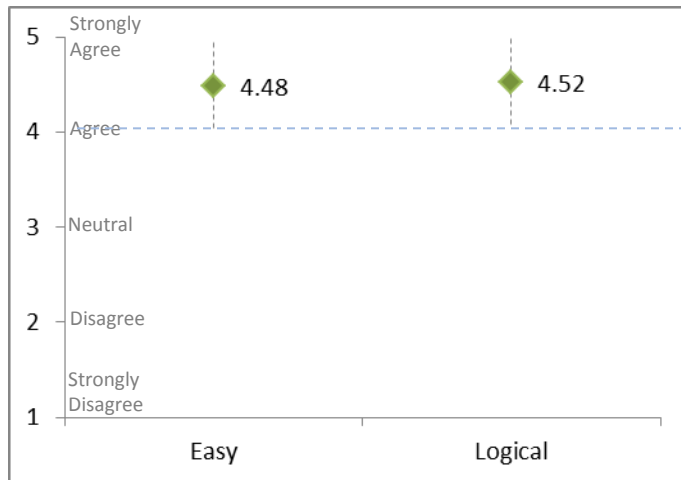

Galaxy SIII Differentiable Product Experience – AllShare Play Photo Streaming

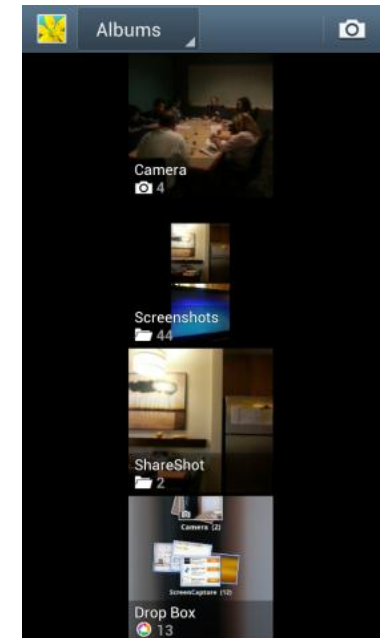

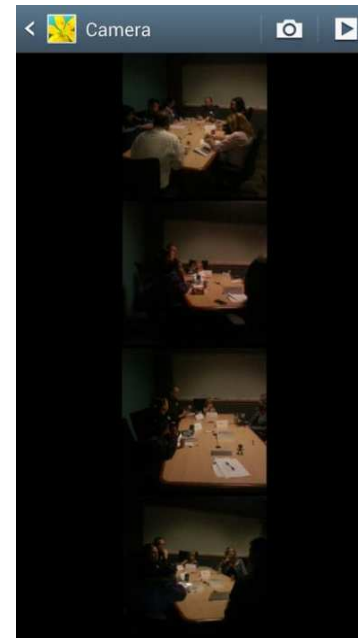

Finding Media to stream (Task Failure Rate: 5%): Usability & Satisfaction

Results:

Finding Media to stream was relatively straightforward – respondents could either went through camera app to access pictures taken by camera or through the Gallery.

The overall experience of finding media to stream was straightforward and easy. Most of the consumers would access pictures taken by their camera through the camera app instead of going to Gallery app directly.

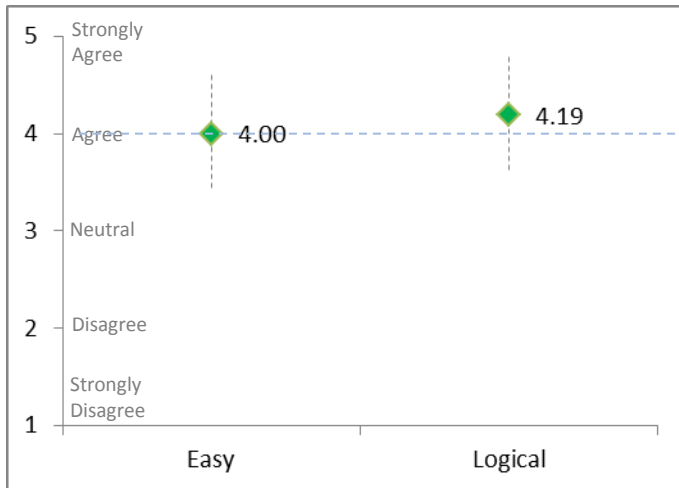

Galaxy SIII Differentiable Product Experience – AllShare Photo Streaming to PC

Finding AllShare Stream (Task Failure Rate: 19%): Usability & Satisfaction

Results:

Consumers have difficulties in identifying the icon for streaming.

The icon representing Streaming to other AllShare-enabled devices seemed to be difficult for more than half of the consumers. Ten of out 21 respondents could complete the task in their first trial. The other 9 would take multiple trials to identify the icon and complete the streaming while 4 respondents could not identify the icon and went to other areas of the device within the allocated time.

Over half of the respondents could not identify the icon initially as streaming to other AllShare-enabled devices.

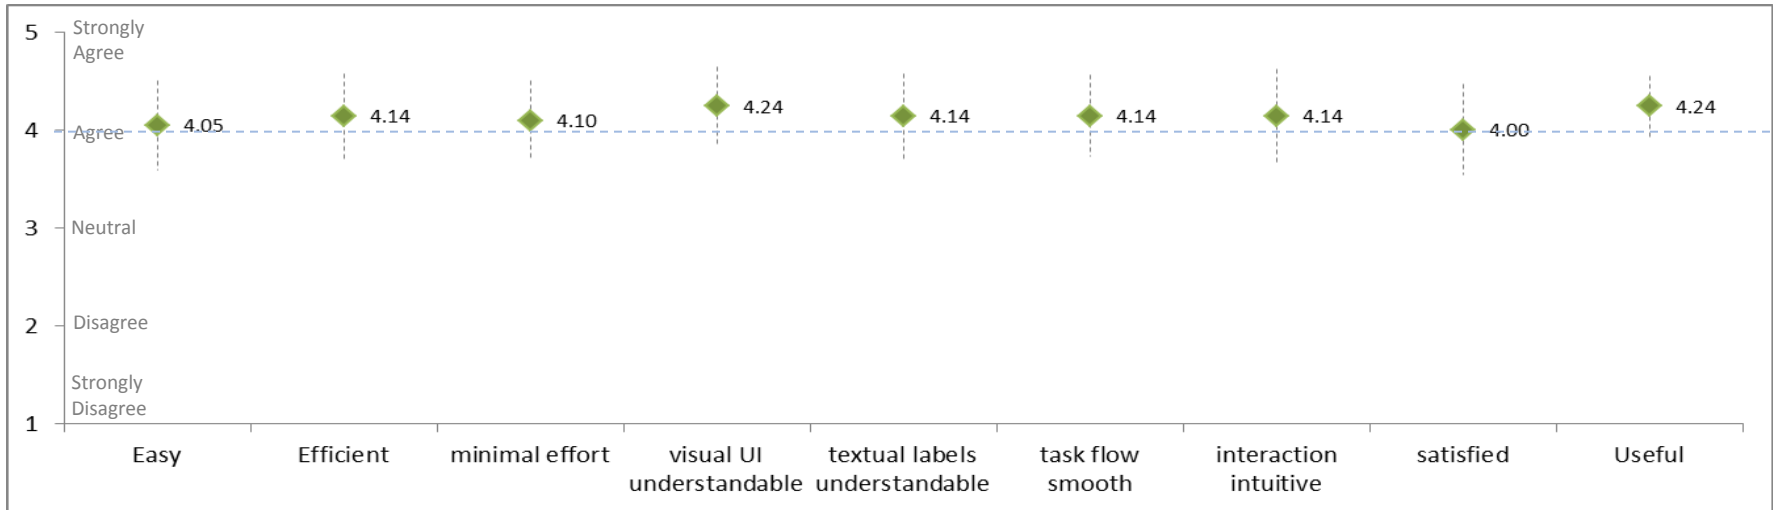

For most of those respondents who could not identify the icon initially, they would look for the feature invocation option under "Share" as their first attempt.

Galaxy SIII Differentiable Product Experience – AllShare Play Photo Streaming to PC

Overall Experience: Usability & Satisfaction

Results:

The overall experience was simple and straightforward after consumers learned the meaning of the icon to stream media to other AllShared enabled devices.

The overall experience of using Play Photo Streaming was simple, though many of the respondents could not identify the onscreen button to perform the function.

Design Suggestions from Respondents and Observations:

1. The visual design of the icon representing Streaming to another device can be enhanced for understandability.
2. The option to stream can also be consistently put into the “Share” menu as one of the options.

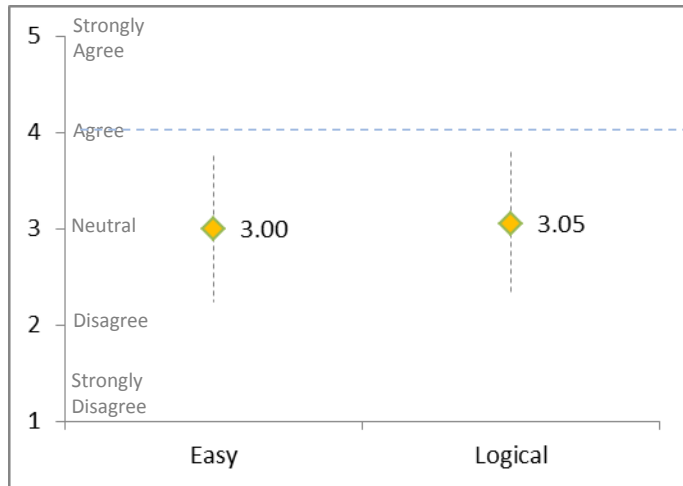

1. Only 20 respondents went through this task because of connection problems during one of the sessions and the task had to be dropped because of time constraint.
2. Hint was given at the start of the task that respondents did not need to sign in AllShare play to join Groupcast.

Galaxy SIII Differentiable Product Experience – Join AllShare GroupCast

Finding AllShare GroupCast (Task Failure Rate: 43%): Usability & Satisfaction

Results:

Consumers have difficulties in discovering how Groupcast can be set up. They expect the icons to be touch buttons in the AllShare App and the GroupCast can be joined (as well as created) by tapping on the icons.

Most of the respondents would intuitively click on the pictures and icons on the display, thinking that they were active onscreen buttons.

The overall experience of joining Group Cast was frustrating for many respondents. They tapped on the icons on the allshare play app repeatedly and was not aware that joining Group Cast is hidden in the menu. Some respondents would try Settings

Design Suggestions from Respondents and Observations:

1. Users should be able to join Group Cast by tapping on icons dedicated to different supported features/functions (including Group Cast) from the allshare play app home screen.
2. The “Join Group Cast” widget (and “Create Group Cast”) can be put in the same home screen as the shortcut to allshare play to increase visibility and ease of invocation.

Galaxy SIII Differentiable Product Experience – Joining AllShare GroupCast

Joining AllShare GroupCast (Task Failure Rate: 43%)

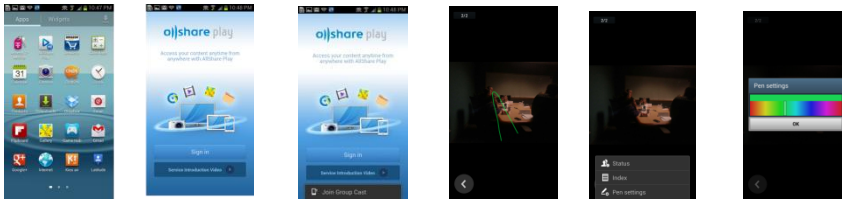

Results:

The high task failure rate of joining Groupcast could be attributed to the difficulties in the initial discovery of the location where the action of joining Groupcast can be completed.

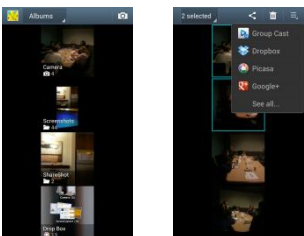

❌ Camera: Pictures

✅ AllShare Play App: Menu

❌ Gallery: Camera: Share: AllShare

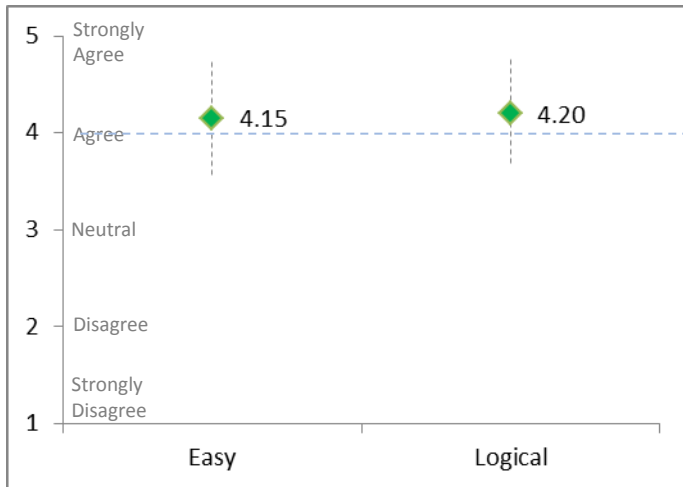

Some respondents created AllShare Groupcast instead of joining an existing Groupcast.

Galaxy SIII Differentiable Product Experience – Joining AllShare GroupCast

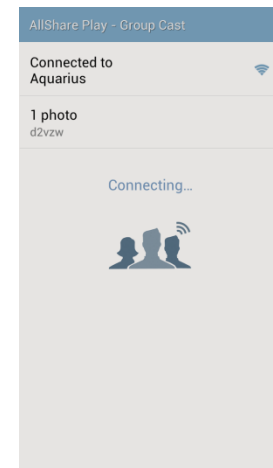

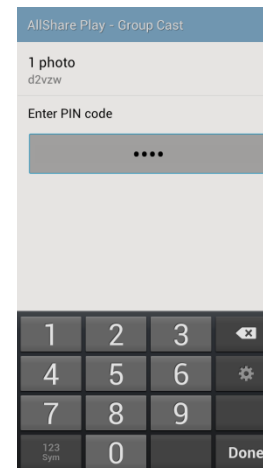

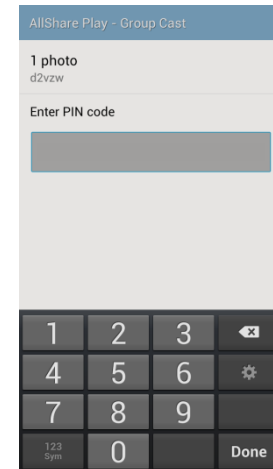

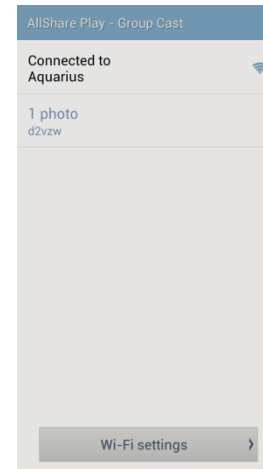

Completing Joining GroupCast (Task Failure Rate: 10%): Usability & Satisfaction

Results:

Consumers did not have any major usability issues once they discovered how they could join Groupcast.

Once consumers knew the location where they could join Groupcast, the subsequent flow was easy and logical.

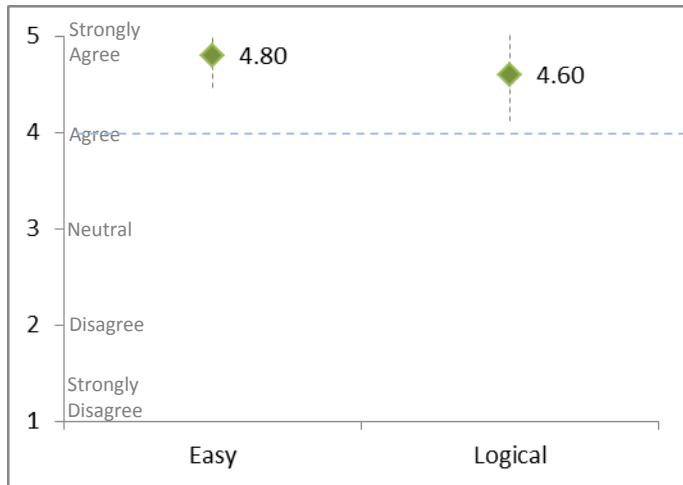

Galaxy SIII Differentiable Product Experience – Joining AllShare Play GroupCast

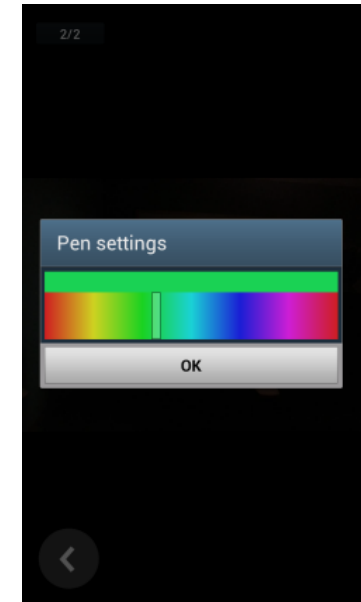

Changing Pen Color (Task Failure Rate: 10%): Usability & Satisfaction

Results:

Consumers rated changing pen color very easy and did not have usability issues related to this task.

Consumers did not have usability issues with changing pen color once they discovered the way to join Groupcast and started to use the application.

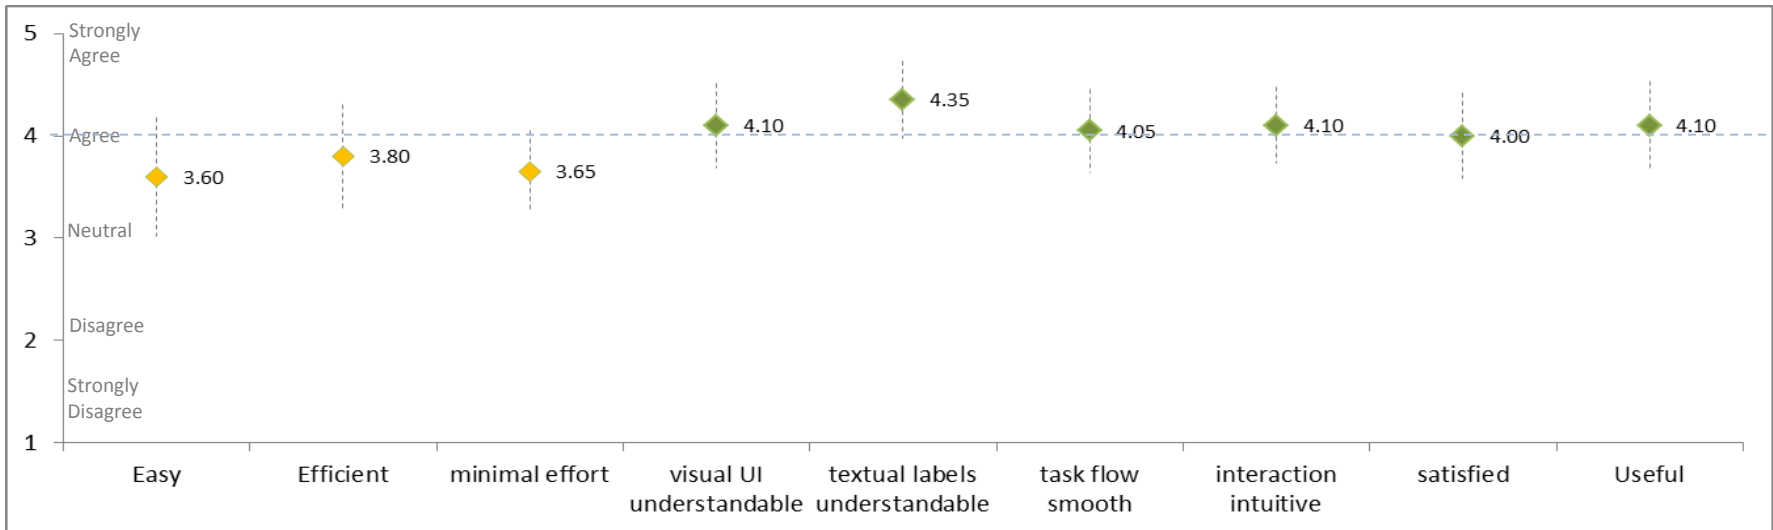

Galaxy SIII Differentiable Product Experience – Joining AllShare Play GroupCast

Overall Experience: Usability & Satisfaction

Results:

Consumers had difficulties in discovering how to join Groupcast. Otherwise, the rest of the steps were relatively easy and straightforward.

Consumer assessment of the overall experience of using Groupcast was mixed. They thought that it was not too easy or efficient to go through the AllShare Play menu to invoke “join Group Cast”

Galaxy SIII Differentiable Product Experience – Creating AllShare Play Groupcast

Creating AllShare Play Groupcast: Overview

Results:

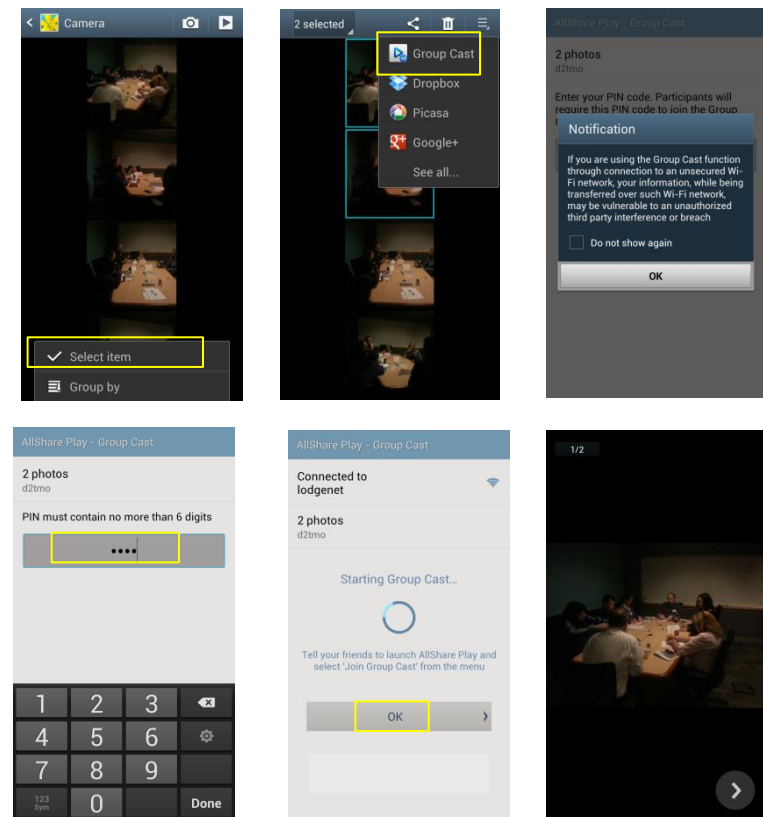

Consumers find creating AllShare Play Groupcast using multiple pictures difficult. In this task, half of the respondents (10 out of 20) went through the correct path to set up multiple selection of media (through Gallery instead of Camera App) in the first trial, but 3 of them did not discover how multiple selection could be done within 2 minutes.

Only 20 respondents went through this task because of connection problems during one of the sessions and the task had to be dropped from that session because of time constraint. Five respondents (5 out of 20) went to the pictures taken by camera through the camera app, which did not support multiple selection of media at all. For consumers who successfully went to pictures in the camera through Gallery where multiple selection of pictures was possible, three of them could not complete multiple selection of pictures.

The lack of multiple media selection support when users tried to access the pictures taken by the camera was unanticipated by consumers. Besides, the interaction design to support multiple selection of media when users accessed the media from the Gallery was not intuitive enough for some respondents, resulting in a relatively high failure rate with consumers landing in Gallery eventually.

The subsequent steps to create Groupcast was relatively simple and the failure rate dropped to 2 out of 20 who did not complete the task.

Example User interface flow to create AllShare Play Groupcast (Detailed Interaction not included)

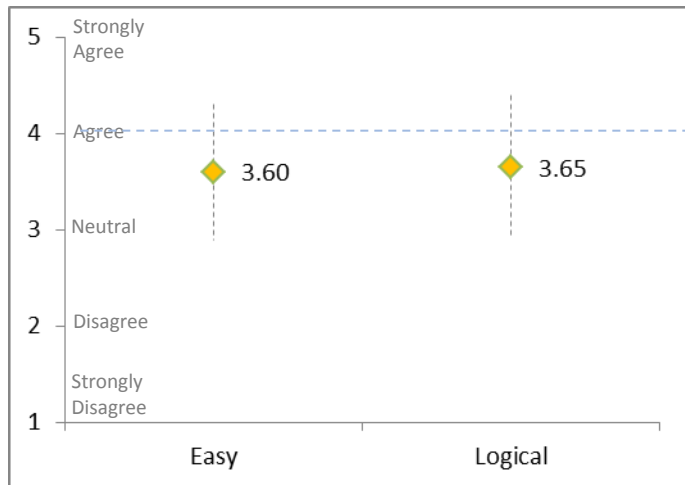

Galaxy SIII Differentiable Product Experience – Creating AllShare GroupCast

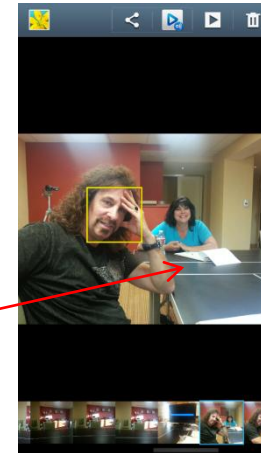

Finding AllShare GroupCast (Task Failure Rate: 43%): Usability & Satisfaction

Results:

Consumers have difficulties in finding the location where multiple selection of media would be supported as accessing pictures taken from camera app does not support multiple selection at all.

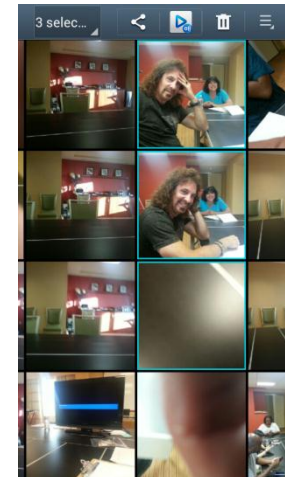

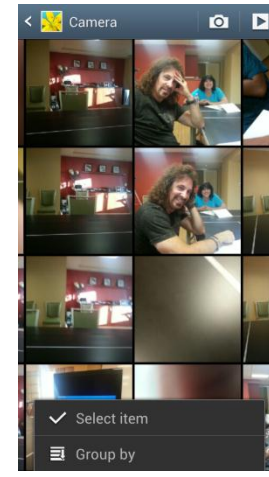

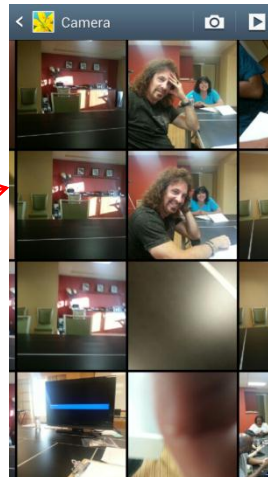

Accessing pictures from camera app could not support multiple selection.

The overall experience of finding the right location to create Allshare Groupcast with multiple media selection was frustrating for quite a few respondents went through the camera app to access pictures taken by the camera instead of going through Gallery.

The only way to perform multiple selection of media was through Gallery app.

Galaxy SIII Differentiable Product Experience – Creating AllShare GroupCast

Finding location supporting multiple media (Task Failure Rate: 25%)

Results:

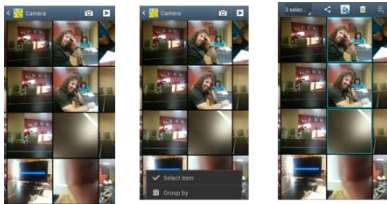

Respondents had difficulties to find the “picture” location where multiple selection of media could be supported .

❌ Camera: Pictures: AllShare Groupcast

Pictures accessed from camera did not support multiple media selection

✅ Gallery: Camera: AllShare Groupcast

❌ AllShare

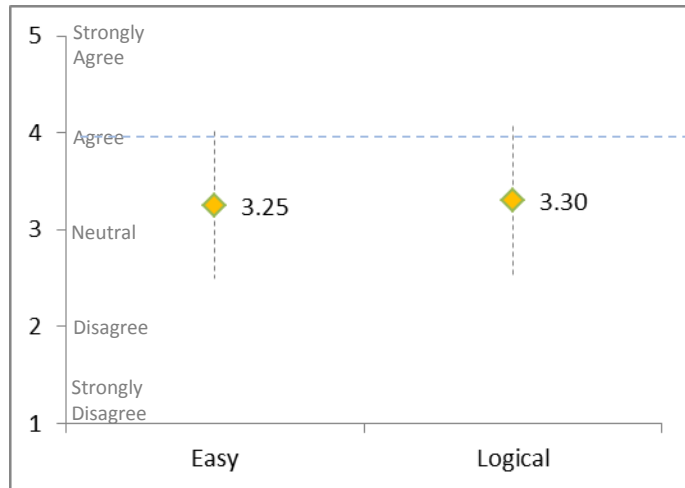

A few respondents would return to AllShare app to explore any additional way to create AllShare Groupcast .

Galaxy SIII Differentiable Product Experience – Creating AllShare GroupCast

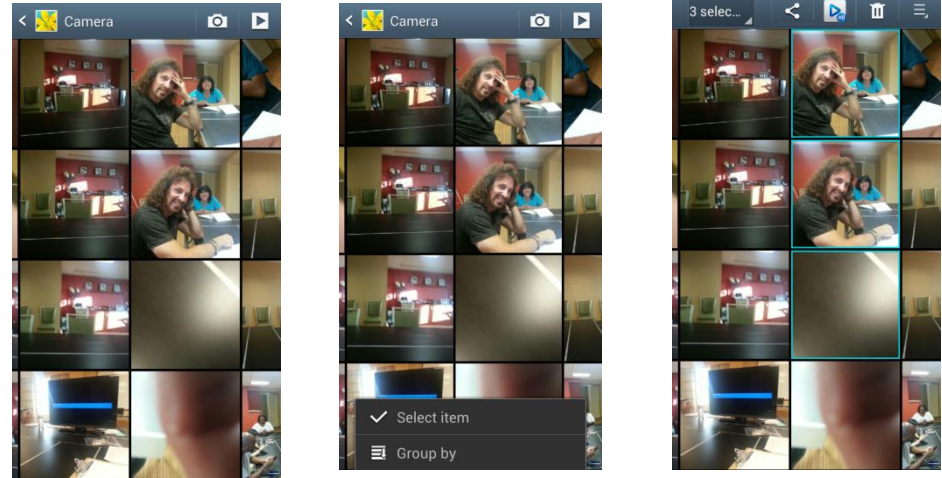

Multiple Selection of Media (Task Failure Rate: 40%)

Results:

Consumers have difficulties in performing multiple selection – the methods of multiple selection are hidden and take effort to discover and use.

Multiple selection of media were difficult for consumers. They would not think of pressing and holding the selected picture (or using the first option of the menu with menu capacitive key) would perform multiple selection.

Design Suggestions from Respondents and Observations:

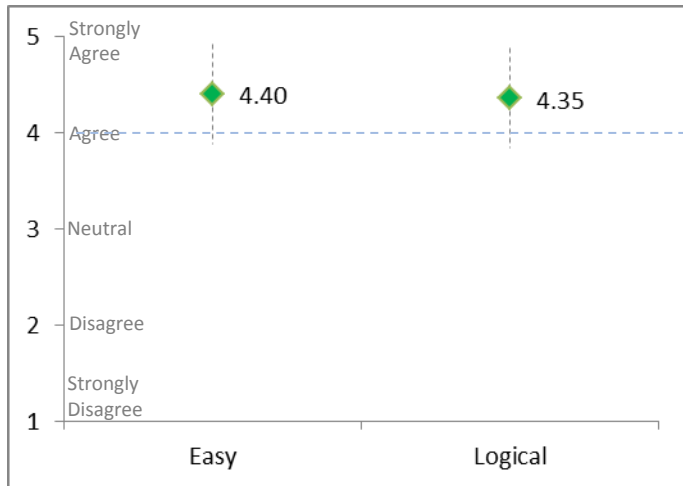

1. A checkbox at the corner of each image can be used to serve as an explicit and visible user interface element for multiple selection. This will likely to reduce task failure of multiple selection drastically.

Galaxy SIII Differentiable Product Experience – Creating AllShare Play GroupCast

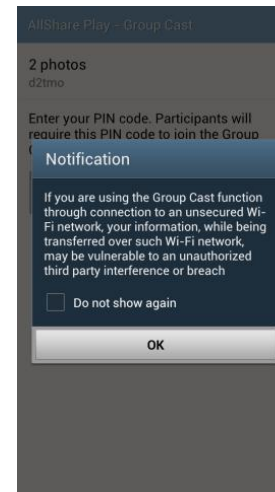

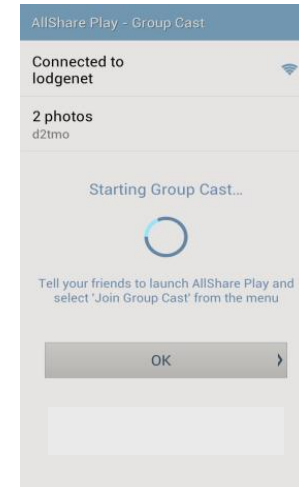

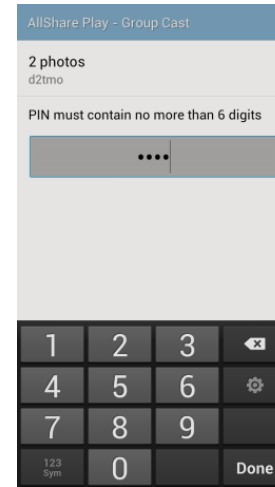

Creating GroupCast (Task Failure Rate: 10%)

Results:

Respondents had little difficulties to complete the task once they could select multiple media and follow through the wizard-like task flow to create Groupcast session.

The failure rate dropped to 2 out of 20 respondents.

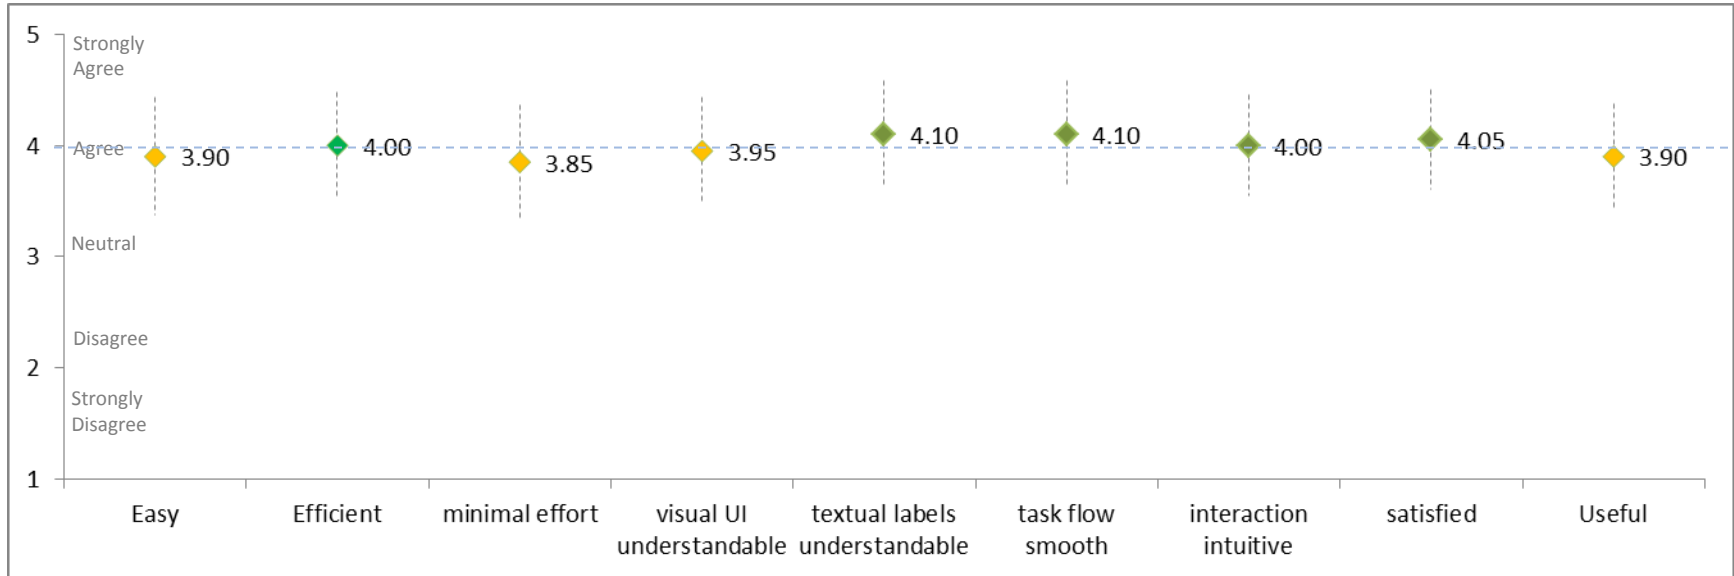

Galaxy SIII Differentiable Product Experience – Creating AllShare Play GroupCast

Overall Experience: Usability & Satisfaction

Results:

Consumers find creating allshare play Groupcast with multiple media

The overall experience of creating Group cast was mixed but was still positive.

Galaxy SIII Differentiable Product Experience – TecTiles

Overview (Task Failure Rate: 0%)

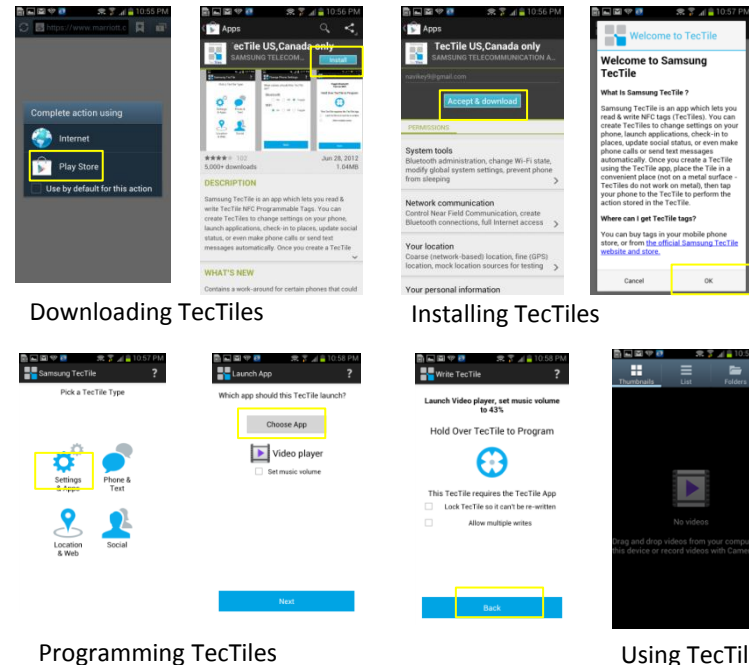

Results:

Consumers have no problems in following through the TecTile discovery, downloading, installation, programming and usage. This was the only task in this research that achieved 0% failure rate for all respondents end-to-end.

All the consumers were able to complete discovery, downloading, installation, programming and using of TecTiles with no usability problems or issues.

The wizard-like user experience flow throughout the various subtasks was easy and logical to follow through with 100% completion rate.

Example User interface flow to invoke and complete
Share shots (Detailed Interaction not included)

Programming TecTiles

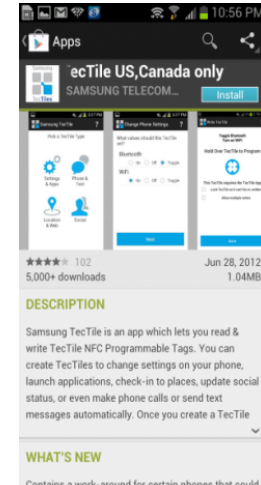

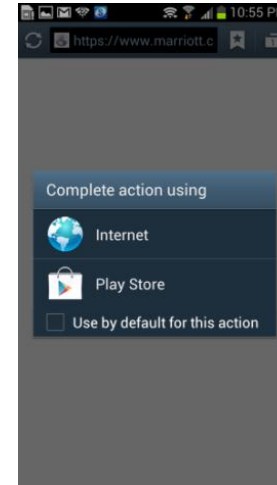

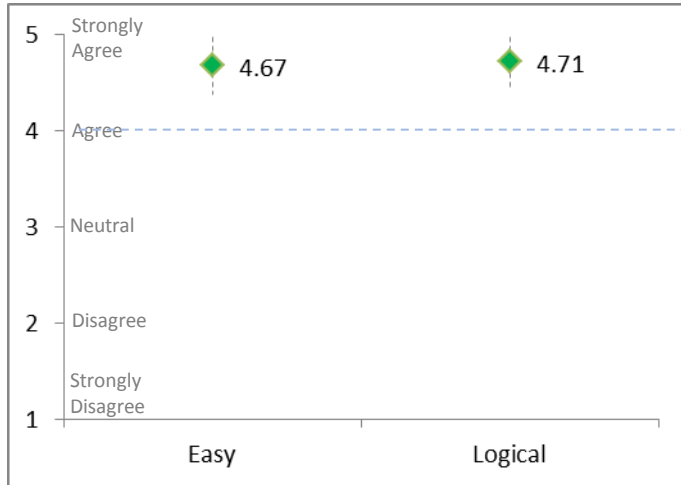

Using TecTiles

Galaxy SIII Differentiable Product Experience – TecTiles

Downloading and Installing TecTiles App (Task Failure Rate: 0%)

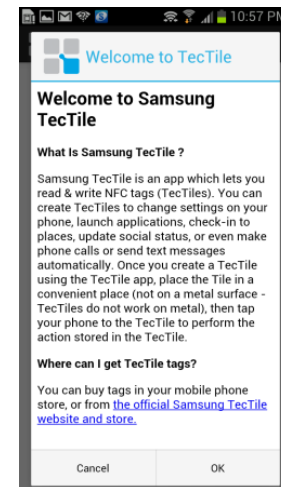

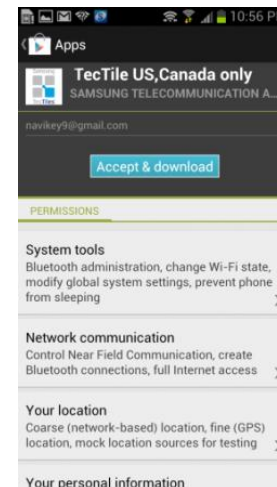

Results:

Downloading and installing TecTile App is easy and straightforward. No usability issues were identified.

The overall experience of downloading and installing TecTiles was easy and logical. There were no usability problems identified in this research.

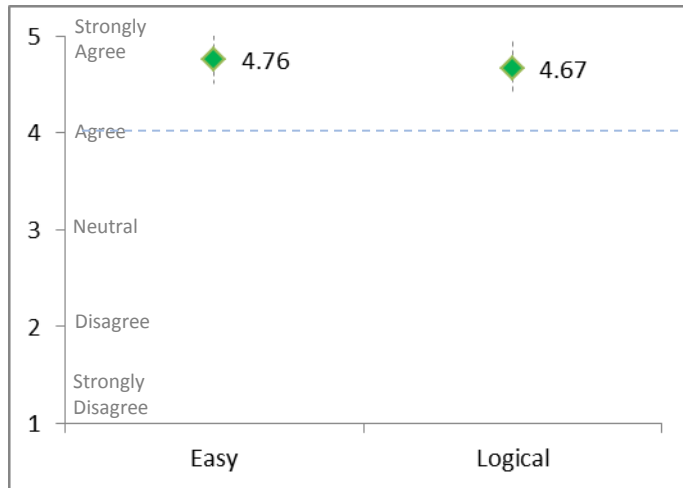

Note: problems in Wi-Fi connectivity occurred during the tasks and in some sessions, respondents would need to repeat the task after switching to another Wi-Fi hotspot.

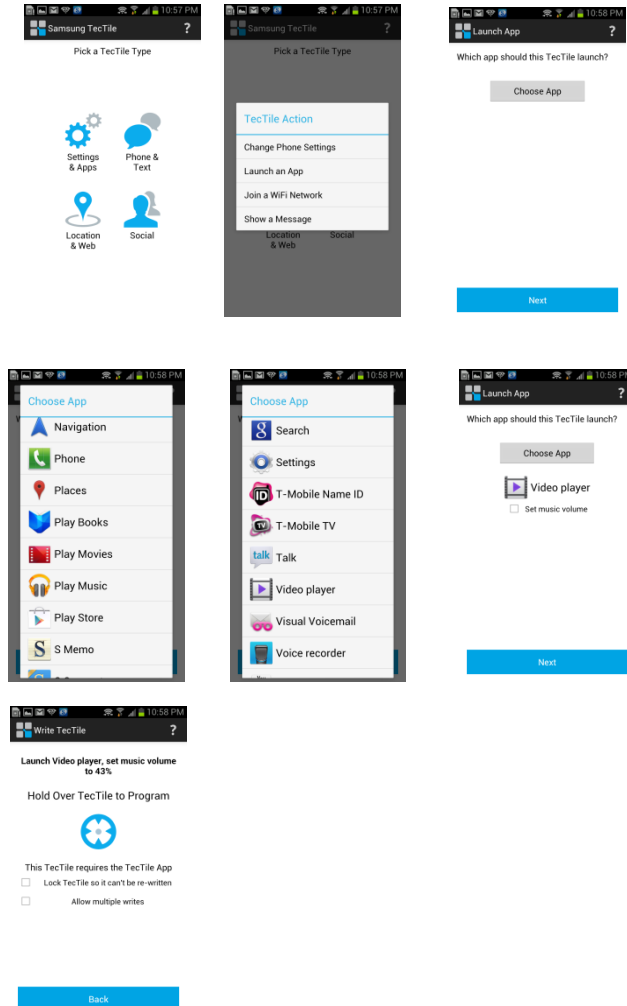

Galaxy SIII Differentiable Product Experience – TecTiles

Programming (Task Failure Rate: 0%): Usability & Satisfaction

Results:
Consumers have no problems in following through the step-by-step wizard-like user interface in programming TecTiles for use

The overall experience of programming TecTiles was easy and logical. There were no usability problems identified in this research.

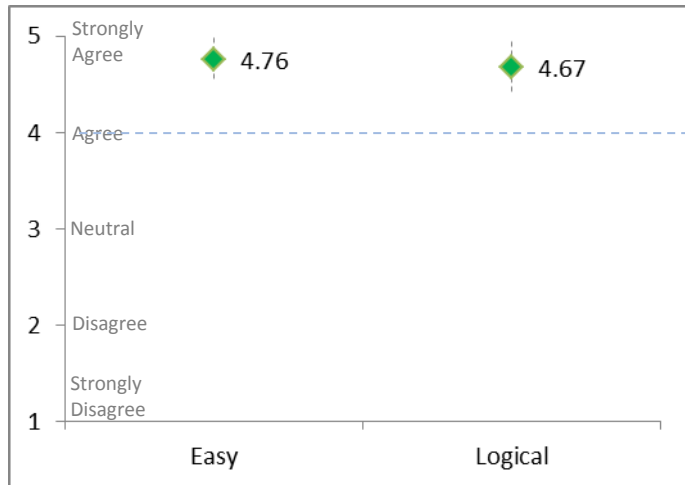

Galaxy SIII Differentiable Product Experience – TecTiles

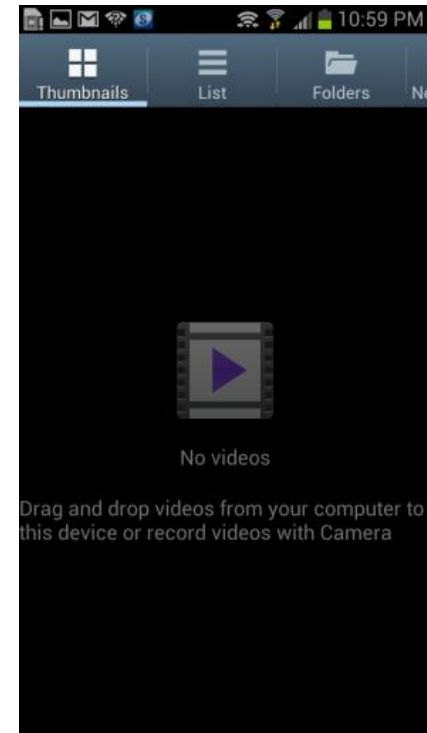

Using TecTiles (Task Failure Rate: 0%): Usability & Satisfaction

Results:

Consumers have no problems in using TecTiles to perform a programmed task.

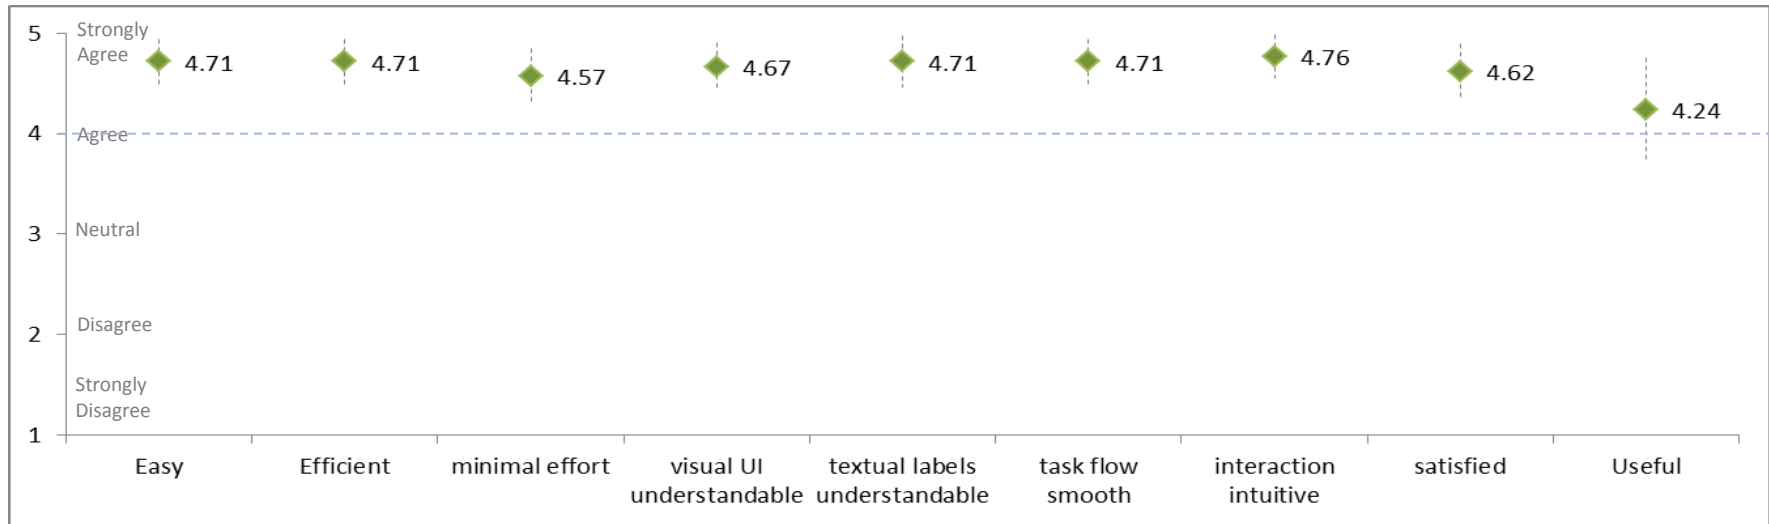

The overall experience of using TecTiles is easy and logical. There were no usability problems identified in this research.

Galaxy SIII Differentiable Product Experience – TecTiles

Overall Experience: Usability & Satisfaction

Insight:
The overall experience of TecTiles was the highest rated product differentiable features in usability.
