CORE COMPETENCIES

Rating

CREATIVITY**Employee Comments:**

1.) Created novel parallel user research methodology to utilize "backup" and "floating" subjects recruited from the primary research project to another research project run by STA User Research team at the same time. This saved STA money as the "backup" and "floating" subjects would get paid even they were not used in any research. Estimated saving in a typical research project was at least \$200 per subject (recruitment cost + subject fee) and we usually would run at least 18 subjects in each research (estimated saving of \$3600 per research project). The biggest possible saving came from saving the cost of conducting the "add-on" research as another project (assuming that there was a 50% chance that we would collect enough data and the cost of a typical user research of that size was around \$30,000, we would have saved an additional \$15,000). Adding the the subject fees, we would have saved around \$200,000 a year. We tried out this practice in Dec last year and put this into regular practice this year from January through December as long as circumstances permitted. 2.) Created user experience research methodology involving multiple users at the same time but still would get quality data from the research. This increased our research productivity by 3 to 4 folds on average. This also translated to better time efficiency and saved cost of holding additional sessions (facilities and moderators cost). This approach, together with using "backup" and "floaters" increased our productivity dramatically. We have covered more than 45 different research projects this year with 3 to 4 large-scale research projects (compared to 2009, we completed about 30 projects with 1 large scale research). 3.) Conducted informal research to establish the feasibility of using Galaxy Tab as a data collection tool (compared to both netbook and paper/pencil). The strategic use of tablets as data collection tools can increase our efficiency by cutting down data entry time and errors.

0

Evaluator Comments:**CHALLENGE****Employee Comments:**

1.) Smartphone and Tablet Form Factor issues - although the future direction smartphones form factor was increasing display size (and hence physical size), it is unlikely that users will be able to carry or use large form factor devices as mobile smartphones effectively. With the support of STA Product Planning, we initiated a series of form factor research which effectively set the limit of physical size of a device as a mobile smartphones. We performed research using both mockups and real devices in the market and found that users would start to have issues with the pocketability, portability and one-hand usage of phones with 4.3" or larger display. The results were shared with HQ so that the constraints of form factor will be considered in the future strategy and direction of smartphones. 2.) Android Hard Key layout issues - the current direction of Android hardkey layouts was Menu, Home, Back and Search from left to right. Two different research projects (one using wax models: Feb 19 2010 and the other using Android devices in market with different key layout: Nov 4, 2010) were conducted. Both research showed users significantly preferred different configurations with the order of Home, Menu, Back and Search than the current direction. Although it is not likely for the company to change direction at this point, these research projects demonstrated the need and importance of having users input into the design process, rather than trying to justify the design after the fact. 3.) The use of multiple subjects in UX evaluation session of user research posed logistic and experimental challenges to us and was initially met with skepticism from the research vendors we worked with. We conducted studies along with the vendors and the process was eventually proven to work effectively. We now conducted those research sessions routinely for research projects that do not require one-on-one sessions (and when more than 1 subject is available).

0

Evaluator Comments:**SPEED****Employee Comments:**

1.) Sidekick QWERTY Keyboard layout: After receiving Next Generation Sidekick QWERTY keyboard layout proposal from T-Mobile (May 3 2010), we planned, conducted and completed a usability/performance study of the QWERTY keyboard layout within 2 weeks. The results were delivered to the Samsung Product Management team as well as the Sidekick project team of T-Mobile User Experience (May 18 2010). 2.) Fast Paced ID Research for Rant3: Conducted a fast-paced Rant3 ID Research to meet timeline for Rant3 design direction by adding it to virtual/physical QWERTY keyboard transition User Research. This impromptu addition stretched the original timing of the user sessions beyond the limit but it was the only way at that time to meet the required turnaround time (report released to Sprint July 29, 2010). 3.) Epic Evolution Form Factor User Research Re-Analysis and Re-Interpretations: After reviewing vendor's report with Strategic Marketing, we decided to have a major overhaul of the report and conducted quantitative analysis that had not been done for the report. Worked through weekends to complete analysis and interpretations to meet the scheduled presentation of results by STA Product Planning to Sprint (report for Sprint released Oct 18, 2010).

0

Evaluator Comments:**STRATEGIC FOCUS****Employee Comments:**

1.) Made and executed user research plans to support and enhance the strategy, product and UX design of Samsung products/services as informed by different internal organizations including STA Design & Technology, STA Product Planning, STA Strategic Marketing Research, STA Product Management, SDA and HQ Design Group & HQ Product Planning. We planned our research based on research requests from these organizations as well as our anticipation and assessments of research needs. Examples: Grip sensor of Continuum user research was done with request from HQ Product Planning; Form Factor research and physical/virtual QWERTY research projects were initiated from STA Product Planning. 2.) In order to become and maintain our position as the market leader, our company will need to excel in many different aspects of our products and services (e.g., the design, marketing, branding and distribution of our products). As user research organization in North America, we have focused upon the development of a UX benchmark that will enable us to compare different aspects of user experience (design/ergonomics, usability, user needs/satisfaction) with competitive products and services. We have used this benchmark for competitive product UX analysis and will seek for further improvement (and/or possible co-development of a standard UX benchmark with HQ Design Group). In this way, we can understand the "total" UX landscape of our products in relation to our competition. The importance of this benchmark is that it is collected from the actual users and representative of users' perspectives, and not from any other UX assessments from either the media, bloggers or internal Samsung employees or organizations. This independence would give us a more accurate picture how our products fared in user experience. 3.) Focus of Galaxy S devices: throughout the year, focus was put to support the UX improvement of Galaxy-S devices before launch. Usability studies as well as comparative UX evaluation with competitive devices in the market were conducted to uncover major usability issues before launch of Galaxy S devices. These included usability studies of prelaunch Galaxy devices for each carrier and 3 iterative usability studies for Continuum (and comparisons to iPhone4, HTC Incredible). Post-launch comparisons of Galaxy S phones with devices in the market were also conducted so that we could learn from both our products and our competitors' products.

Evaluator Comments:**SIMPLICITY****Employee Comments:**

1.) Added Executive Summary, Fast Facts and/or Research Insights sections to the research reports to convey complex data and results in a visual and understandable manner (starting from March 2010 and continued to simplify and streamline "Executive Summary", adding "Fast Facts" and "Improvements & Action Items" from August 2010) 2.) Organized regular face-to-face "STA User Research Results Sharing Workshops/Colloquia" to encourage direct and open dialogue with key members from Design & Technology (Concept Creation), Product Planning, Strategic Marketing Research, Strategy Marketing Intelligence and Product Management for participation. (Nov 4, Nov 18, Dec 9 2010) 3.) Released user research reports through STAR with highlights of the research findings (Jan 2010 through August 2010). Released user research reports with highlights of the research findings through email to the invitees of the monthly STA User Research Results Sharing Workshops/Colloquia and/or other recipients recommended by the STA teams (Nov 2010 through Dec 2010)

Evaluator Comments:**SELF-CONTROL / EMPOWERMENT****Employee Comments:**

1.) Initiated, planned, conducted and completed various user research projects that were critical to the company within a relative short time frame (two to four weeks lead time including recruiting subjects). Examples: a series of form factor and QWERTY (physical and/or virtual) user research projects, competitive UX of Galaxy S smartphones for AT&T, Sprint, T-Mobile and Verizon. 2.) Effort and time to have research done right: As many of our user research started early in the week, we also held some of our research final preparation meetings on Sundays (examples: Feb 7, April 25, July 18, Sept 26, Oct 24 2010). I am also personally involved into most of the research projects from conception to data analysis and report writing and attended most of the research sessions or carried out parallel research sessions during the sessions. The working hours of research sessions were usually fairly long, from setting up the site and the research to running the sessions throughout the day (typical schedule was from 7:30am to about 8:00pm with a 45-minute lunch break). 3.) Personal accountability of research data and results: I adopted an open door policy for sharing data with internal organizations whenever is possible. We spent time to ensure that data we collected were valid and put extra attention to the integrity of data (unbiased research methodology, data entry accuracy, appropriate data analysis etc.) and would share data/results with internal organizations upon request so that they can either conduct further analysis or verify that our analysis is conducted appropriately. Example: we sent our Form Factor research results/report and the internal report of Epic Evolution Form Factor study to HQ Design Group for their reference and critique. We also shared the methodology with HQ Design Group for feedback & critique whenever was practical.

Evaluator Comments:**CUSTOMER FOCUS****Employee Comments:**

1.) Collaboration with T-Mobile TUX: Presented Research Findings at T-Mobile Design Research Workshop in February 2010. This included updates from QWERTY research and planning for joint research activities (Feb 25). Worked with TUX (T-Mobile User Experience) on their Sidekick users focus groups. Upon request from T-Mobile, we collaborated with them for New Product Concept Research (Dual Screen Mobile Device Product Concept Feb-Apr 2010). Results and report published and shared May 8, 2010. 2.) Collaboration with Sprint UXD: Coordinated with Sprint UXD, HQ Design Group and STA Product Management to organize an UX Design Research Workshop (March, April 2010) covering virtual QWERTY design and practices, learning from messagings research, QWERTY keyboard research update and Android keys placement research. Workshop was held on April 1st, 2010. 3.) Collaboration with Verizon UX: Conducted three iterative UX evaluations of Continuum to improve UX and hardware feature design (reports released May 1, July 9, and Oct 4, 2010). Results were shared with HQ Design Group, STA Product Management, STA Product Planning, HQ Product Planning as well as Verizon's UX for changes. Conducted QWERTY user performance/usability testing for Reality2 and Intensity3 layout. Presented QWERTY research update (both physical and virtual) at the Verizon Design Camp (Nov 12 2010). Verizon UX have requested us to conduct and share future Form Factor Research results and analysis as well as updates from QWERTY keyboard research (especially virtual keyboard and user input utilizing different text input technology). 4.) Research Sharing Session with AT&T UX & Product Management team in AT&T/Samsung Design Workshop (hosted by HQ Design Group) - Presented QWERTY research update (physical and virtual) during AT&T Design Workshop on Oct 7, 2010. AT&T UX requested to share research results on virtual QWERTY keyboards and form factor research during the workshop.

Evaluator Comments:**CRISIS AWARENESS****Employee Comments:**

1.) Flexible and Backup Planning for user research: in the planning of our user research projects, we have included contingency plans in case that any of the planned research could not be conducted. The nature of our research dictated us to have "backup" research projects available so that we can swap those into the research sessions at the last moment if needed. We had to use our contingency plans for several research as we did not receive the prototypes or mockups as promised in the timeframe of the scheduled research (or we received the mockups/prototypes after the scheduled arrival date). Example: in the comparison of different QWERTY sizes (QWERTY keyboards of 4.5" display, 4.3" display mockups) for Epic Evolution project, we did not receive any mockups at all so we used the QWERTY keyboard Emulator to simulate the respective keyboard sizes on a ultra-mobile PC. 2.) Epic Evolution Form Factor User Research Re-Analysis and Re-Interpretations: After reviewing vendor's report with Strategic Marketing Research, we decided to have a major overhaul of the report and conducted more extensive quantitative analysis that had not been done for the report. Worked through the weekend to meet the timeline for the presentation to the carrier. 3.) User Research of Galaxy S series smartphones: in anticipation to the launch of Galaxy S phones this year, we have started to conduct user research at the beginning of 2010, getting hold of any prototypes as we can. We started by borrowing Galaxy S prototypes from Advanced Quality Control team to conduct UX evaluation and comparison of Contacts Application in February and continued to perform usability evaluation using Continuum and culminate in a large-scale usability evaluation of prototype Galaxy S phones for AT&T, T-Mobile, Sprint & Verizon at the end of May. This enabled us to provide early feedback on both the industrial design and the UX so that major issues can be addressed before launch. Example: simplification of the home screen edit process.

Evaluator Comments:

CONTINUOUS INNOVATION

Employee Comments:

1.) Continually sought to improve and advance research methodology, data analysis techniques and procedures to reduce errors and increase validity. Examples of these activities included the use and improvement of "Just Right" scale to include "acceptable" ranges gauged by the respondents that would indicated the maximum and minimum design attributes tolerated by respondents (e.g., size of mobile device). 2.) Continually to improve STA UX Index Inventory - Pioneered, designed, implemented and continually improved the STA UX Indices Inventory which consists of 78 items, measuring overall design, usability and users' needs and satisfaction of products and services to provide a common framework of comparisons of different products. The first study using the index was launched with the competitive UX benchmarks of Nexus-1 and Hero (report released Feb 28, 2010). The STA UX indices methodology and protocol was continually improved and used in later studies (13 different research projects involving competitive benchmarking of devices or services). 3.) Investigation and usage of new research tools: prompted the research team to try out new analysis or research tools to enhance the quality of our research analysis and interpretations. Example: As part of our foray into ethnographic research, the research team would try out different video coding tools by downloading the trial versions and doing sample video coding and tagging from some of the videos we took in the recent Augmented Reality and Location-Aware Applications Field Research (report released Dec 10 2010 and video tool evaluation will be conducted in late December).

Evaluator Comments:

TEAMWORK

Employee Comments:

1.) Collaborated with STA Strategic Marketing Research on all the user and product research projects: Actively sought for critique, feedback and advances in research and testing methodology, protocols, data analysis and research reports for every project done, improving the quality and rigor of the entire research process (Jan through Dec 2010). 2.) Collaborated with HQ Design Group & SDA on user research projects - example: Mobile QWERTY Keypad Key Shape/Curvature User Research (May, June 2010), HQ Design Group supplied mockups and drawings for the research while STA provided protocols/methodology and managed the research with HQ input; Results were used in HQ Design group planning of 2011 products. Other examples included input and feedback from HQ Design Group: Competitive Virtual QWERTY Keyboard Layout for Smartphones and Tablets. The results of the study were shared with HQ Design Group for improvement in 2011 virtual keyboard layouts. Collaboration with SDA on key tallness user discrimination and preference research with SDA Product Design supplying wax models (report released Feb 18, 2010). 3.) Collaborated within Technology, and Design, (Concept, Creation) team on important concepts or research questions to provide user research support for product concept development and user experience enhancements. Examples included finding the minimum x-height font in WVGA, HVGA and QVGA devices and different concepts of "Thumbs" QWERTY layout. 4.) Served as user research advisor for the Advanced Quality Group at HQ when they conducted their usability research of Galaxy S devices in the US (Feb, May 2010).

Evaluator Comments:

LEADERSHIP

Employee Comments:

1.) Set research direction and examples for two new design research associates by stepping through the actual research process covering planning, preparation, data collection, data analysis and interpretation as well as reports writing with rigor and integrity with them doing actual research. Advocated the importance of reporting true results and data as well as the possible limitations and constraints of the research process. 2.) Set example by advocating the importance of the discipline and rigor of user research methodology, data integrity and report objectivity for both HQ and STA organizations as well as external vendors (Gist Design, Strategy Analytics and HumanCentrics). Example: in the data analysis and validation of the research done by external vendors on behalf of STA, we came across data that had not been coded correctly and/or incorrect data analysis (e.g., in Comparative Smartphone OS UX research, several statistical analyses were conducted incorrectly). We made use of this as a learning experience for our research team as well as for the external research agency by tracing the errors and showing the differences in data interpretation (and hence the results and recommendations) those errors could cause. 3.) Delegated challenging research projects (examples: Form Factor Study of touch-only mobile devices: smartphones and tablets, virtual QWERTY keyboard user performance, Sprint Rant3 ID design) to the research team and empowered them to plan and run the research. Provided technical support, data analysis and interpretations and insight throughout the process to provide learning opportunities for the team.

Average 0.00

ACCOMPLISHMENTS & GOALS

ACCOMPLISHMENTS

Employee Comments:

Accomplishments: 1.) Smartphone and Tablet Form Factor User Research Program (3 reports): Two large-scale Form Factor User Research projects have been completed, in addition to the data collected from other competitive UX research of current devices. Impact: the form factor of devices with 4" display, 3.7" display & 4.3 display (with

both mockup and current devices in the market) have been established to be most preferred devices form factor as smartphone. Both 7" and 9.7" display devices are most preferred form factor as tablets. Touch-physical QWERTY with 4" display is more preferred than touch-physical QWERTY with 4.3" and 4.5" display. 2.) User Experience and Usability Comparison and Improvement Program (16 reports): Covered comparative OS UX platforms including Android 2.2, Windows 7 Mobile, Blackberry OS 6, Apple OS 4 as well as many competitive Android devices in the market including HTC Evo, Motorola Droid-X, HTC Incredible; Other topics included UX evaluation fo Media Hub, comparative UX of tablets, netbook and smartphones. Impact: knowledge of consumers perception of strengths and weaknesses of the devices and services in the following areas (overall design in terms of industrial design appeal, form factor, emotional design, overall usability in touchscreen UX, font legibility, navigation and system usability scores, user needs and satisfaction in terms of values in consumers social contexts and usefulness); acceptability of form factor and overall design and design problems and issues. Recommendations made to correct design issues. 3.) Mobile QWERTY Design Best Practices (16 reports) Covering many different areas of Mobile QWERTY keyboard and key design, from key tallness, keyboard size comparison, different key layout comparisons using QWERTY keyboard simulators as well as competitive benchmark of different keyboards in the market. Impact: Keyboard design decisions on tallness, key shapes, key mappings, different keyboard layout comparisons (between carrier requested layouts and competitive layouts, especially from Verizon) for keyboard design direction. Virtual keyboard layout validation/design improvements (both 2010 and 2011) for HQ Design Group. 4.) General Usability and Design (11 reports) Covering topics including Android Hard key design, comparative Navkey control performance and user satisfaction, visual design theme comparison etc. Impact: results were used as a reference for future product design decisions

Evaluator Comments:

AREAS OF DEVELOPMENT

Employee Comments:

1.) Continue to improve the effectiveness and efficiency of user research process. One of the intermediate goals is to transition to Galaxy Tab as data collection devices (and requesting our research vendors to do the same) instead of using laptops or paper/pencil Q1 or Q2 next year. 2.) Continue to simplify the presentation of complex research insights and results. Develop detailed recommendations of product improvements based on research results. 3.) Develop processes and/or leverage on other organizations to make use of the research results for product improvement process.

Evaluator Comments:

FUTURE GOALS

Employee Comments:

1.) become a world-class user research expert with both top-notch quantitative and qualitative research skills. 2.) continue to enhance research methodology and analysis framework and provide valid and insightful results for the company to improve upon our products and services to be #1 in the marketplace. 3.) advocate professional integrity and ethics as a researcher and scientist.
